# STATISTICAL DESCRIPTION OF DATA

(Introduction to Statistics)

# Introduction:

| The word "STA     | TISTICS" I | nas its origin from the fol | llowing:                                     |
|-------------------|------------|-----------------------------|--|
| • Latin           | -          | STATUS                      |  |
| • German          | -          | STATISTIK                   |  |
| • French          | -          | STATISTIQUE                 |  |
| • Italian         | -          | STATISTA                    |  |
|                   |            |                             |  |
| Statistics in Inc | lia        |                             |  |
| • Kautilya        | recorded   | birth and death in Art      | hashastra during Chandragupta Maurya's       |
| regime.           |            |                             |  |
| Abul Faze         | al, during | Akbar's regime, record      | led agriculture in the book Ain-i-Akbari.    |
|                   |            | <b>"STATISTICS"</b>         | DEFINED                                      |
|                   |            |                             |  |
|                   | ł          |                             | ↓  |
| IN SINGL          | ILAR SENS  | E                           | IN PLURAL SENSE                              |
| It is defin       | ed as the  | scientific method           | By Statistics, we mean aggregate             |
| of collect        | ing, prese | enting, analyzing           | of facts which are known as                  |
| the data          | and draw   | ving inference from         | "DATA" (Singular Datum).                     |
| the same          | 2.         |                             |  |
|                   |            |                             |  |
|                   |            |                             |  |
| Features of Sta   | tistics:   |                             |  |
| a) Statistics     | deals wi   | th masses and not indi      | viduals.                                     |
|                   |            |                             |  |
| b) Statistics     | deals wit  | h quantitative data . C     | Qualitative data are also to be expressed in |
| quantitat         | tive terms | •                           |  |
|                   |            |                             |  |
| c) It is aggr     | egate of f | acts (plural sense).        |  |
|                   |            |                             |  |

| d)      | It refers to scientific methods of analyzing data.(Singular Sense)                |
|---------|---|
| <br>    |   |
| <br>e)  | It is science as well as an art.  |
| <br>f)  | Data are affected by multiplicity of causes.                                      |
|         |   |
| g)      | Data should be collected in a systematic manner and for a pre-determined purpose. |
| <br>    |   |
| <br>h)  | Data should be comparable.  |
| <br>i)  | All Statistics are Numerical Statements but all Numerical Statements are not      |
| <br>''  | statistics  |

| LIM  | TATIONS OF STATISTICS  |
|------|--|
| i.   | Statistics does not study qualitative phenomenon directly.                                     |
|      |  |
| ii.  | Statistics does not study individuals.   |
|      |  |
| iii. | Statistical laws are not exact.  |
|      |  |
| iv.  | Statistical data are liable to be misused.   |
|      |  |
| v.   | Statistics results are true on the average sense only. They are not exact                      |
|      |  |
| FEW  | / TERMS COMMONLY USED IN STATISTICS.   |
| i.   | Data : It is a collection of observations, expressed in numerical figures, obtained by         |
|      | measuring or counting.   |
|      |  |
| ii.  | <b>Population :</b> It is used to denote the totality of the set of objects under considering. |
|      |  |
| iii. | Sample : A sample is a selected no. of individuals each of which is a member of                |
|      | the population. It is examined with a view to assessing the characteristics of the             |
|      | population.  |
|      |  |
| iv.  | Characteristic : A quality possessed by an individual person, object or item of a              |
|      | population is called a characteristic e.g. Height, age, nationality, etc.                      |
|      |  |
| ٧.   | Variable & Attribute : Measurable characteristics which are expressed numerically              |
|      | in terms of some units are called as variables or variates e.g. age, height, income,           |
|      | etc. Non-measurable characteristics is a qualitative characteristic which is called as         |
|      | attribute e.g. sex, marital status, employment status, etc.                                    |
|      |  |
| vi.  | Continuous & Discrete Variable : A variable which can assume for its value any real            |
|      | quantity within a specified interval is a continuous variable e.g height, weight etc           |
| <br> | and the variables which can assume only whole numbers are discrete variables                   |
|      | eg : number of members in the family, no of accidents etc.                                     |
|      |  |
|      |  |

| <br>    |      | onological classification.  |            |  |
|         | a)   | for some hours              |            |  |
| <br>    | b)   | over a period of time       |            |  |
|         | c)   | seriously                   |            |  |
|         | d)   | none of the above           |            |  |
|         |      |                             |            |  |
|         |      |                             |            |  |

| 30. |            | classification refers to the classification of data according to some |
|-----|------------|---|
|     | cha        | racteristics that can be measured.                                    |
|     | α)         | qualitative   |
|     | b)         | subjective  |
|     | c)         | quantitative  |
|     | d)         | all of the above  |
|     |            |   |
| 31. | Clas       | ssification is the process of arranging data in:                      |
|     | α)         | different columns   |
|     | b)         | different rows  |
|     | c)         | grouping of related facts in different classes                        |
|     | d)         | different columns and rows  |
|     |            |   |
| 32. | ln c       | hronological classification data are classified on the basis of:      |
|     | α)         | attributes  |
|     | b)         | class interval  |
|     | c)         | locations   |
|     | d)         | time  |
|     |            |   |
| 33. | Geo        | graphical classification means classifications of data according to:  |
|     | a)         | time  |
|     | b)         | location  |
|     | c)         | attributes  |
|     | d)         | class intervals   |
|     |            |   |
| 34. |            | primary rules that should be observed in classification:              |
|     | Ι.         | As far as possible, the class should be of equal width.               |
|     | <b>II.</b> | The classes should be exhaustive.                                     |
|     | III.       | The classes should be un-ambiguously defined.                         |
|     |            | a) Only I and II  |
|     |            | b) Only II and III  |
|     |            | c) Only I and III   |
|     |            | d) All I, II and III  |
|     |            |   |
|     |            |   |

| 4. | Body : The arrangement of the data according to the descriptions given in the captions |
|----|--|
|    | (columns) and stubs(rows) forms the body of the table. It contains the numerical       |
|    | information which is to be presented to the readers and forms the most important       |
|    | part of the table.   |

5. **Box-head:** The entire upper part of the table is known as box-head.

Each of the Diagram is described below:

# Line Diagram :

It is used for time related data (Time series).

When there is wide range of fluctuations, logarithmic or ratio charts are used.

# Multiple Line Chart :

It is used for representing 2 or more related series expressed in same units.

| Mul    | tiple Axis Chart :   |
|--------|--|
|        | Multiple Axis Chart is used for representing two or more related series expressed in     |
|        | different units.   |
|        |  |
| Sem    | i-Logarithmic Graph or Ratio Chart :   |
|        | Semi-Logarithmic Graph or Ratio Chart is a line diagram drawn on a special type          |
|        | of graph paper which shows the natural scale in the horizontal direction and the         |
|        | logarithmic or ratio scale in the vertical direction. The semi-log graph is used where   |
|        | ratios of change are more important than absolute amounts of change.                     |
|        |  |
|        | Diagram  |
| 1.     | Vertical Bar Chart ( or Colum Chart) :   |
|        | This is generally used to represent a time series data or a data which is classified by  |
|        | the values of the variable. (Measurable characteristics).                                |
| <br>2. | Horizontal Bar Chart :   |
|        | This is used to represent data classified by attributes or data varying over space.      |
|        | (i.e. non-measurable characteristics).   |
|        |  |
| 3.     | Grouped or Multiple or Compound Bar Chart):  |
|        | These are used to compare related series.  |
|        |  |
| 4.     | Component /Sub divided Bar Chart:  |
|        | These are used for representing the data divided into different components               |
|        |  |
| 5.     | Percentage Bars :  |
|        | Percentage Bars are particularly useful in statistical work which requires the           |
|        | portrayal of relative changes.   |
| <br>6. | Deviation Bars   |
|        | Deviation Bars are popularly used for representing net quantities – excess or deficit    |
|        | i.e. net profit, net loss, net exports or imports, etc. Such bars can have both positive |
|        | and negative values. Positive values are shown above the base line and negative          |
|        | values below it.   |
|        |  |
|        |  |

## 7. Broken Bars

In certain series there may be wide variations in values – some value may be very small and others very large. In order to gain space for the smaller bars of the series, larger bars may be broken.

# PIE CHART / PIE DIAGRAM / CIRCLED DIAGRAM

This is a very useful diagram to represent data which are divided into a number of categories. The diagram consists of a circle divided into a number of sectors whose areas are proportional to the values they represent. Again the areas of the sectors are proportional to their angles at the centre. Therefore, ultimately the angles of the different sectors are proportional to the values of different components. The total value is represented by the full circle. Comparison among the various components or between a part and the whole of data can be made easily by this diagram.

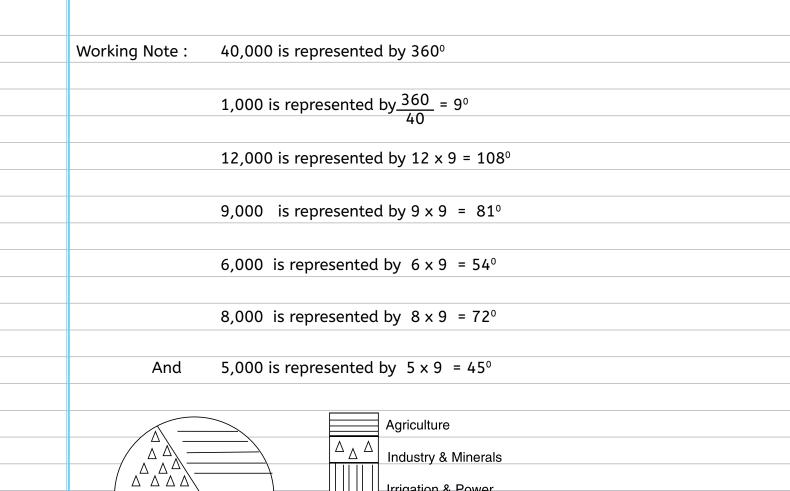

### Example :

Draw a pie chart to represent the following data on the proposed outlay during a Five-year Plan of a Government :

| Iten  | ns               | ₹ (in crores) |
|-------|------------------|---------------|
| Agr   | riculture        | 12,000        |
| Indu  | ustry & Minerals | 9,000         |
| Irrig | gation & Power   | 6,000         |
| Edu   | ucation          | 8,000         |
| — Con | nmunication      | 5,000         |

Calculations for the angles of the pie chart

| <br>Items               | Outlay (in crores ₹) | Angles (in egrees) |
|-------------------------|----------------------|--------------------|
| Agriculture             | 12,000               | 108                |
| <br>Industry & Minerals | 9,000                | 81                 |
| <br>Irrigation & Power  | 6,000                | 54                 |
| Education               | 8,000                | 72                 |
| Communication           | 5,000                | 45                 |
| <br>Total               | 40,000               | 360                |

# DIAGRAMMATIC/GRAPHICAL REPRESENTATION OF FREQUENCY DISTRIBUTION

000

Irrigation & Power

Communications

Education

#### 1. Histogram or Area Diagram

 $\bigcirc$ 

- i) It consists of a set of adjoining vertical rectangles whose widths represent the class intervals and the heights represent the corresponding frequencies (for equal class width) and frequency densities (for unequal class width). Boundaries are plotted along the horizontal axis and the frequencies (or frequency densities) are plotted along the vertical axis
- ii) The area of each rectangle is proportional to the frequency of the corresponding class.
- iii). Mode is calculated graphically from Histogram.

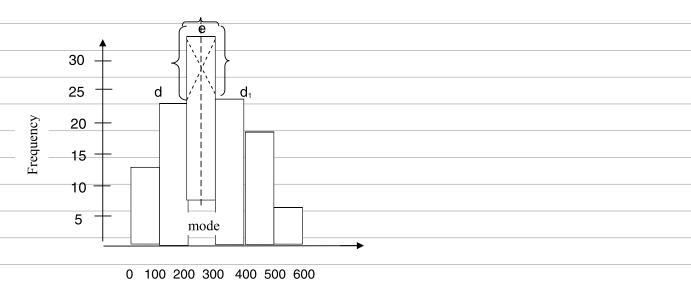

- iv) It helps us to get an idea about the frequency curve and frequency polygon.
- v) Comparison among the frequencies can be made for different class intervals.

### Example

| The monthly profits in rupees of 100 shops are distributed as follows: |       |         |         |         |         |         |  |  |  |
|--|-------|---------|---------|---------|---------|---------|--|--|--|
| Profits per Shop   | 0-100 | 100-200 | 200-300 | 300-400 | 400-500 | 500-600 |  |  |  |
| <br>No. of Shops   | 12    | 18      | 27      | 20      | 17      | 6       |  |  |  |

Draw the histogram to the data and hence find the modal value.

In the histogram, the top right corner of the highest rectangle is joined by a straight line to the top right corner of the preceding rectangle. Similarly, top left corner of the highest rectangle is joined to the top left corner of the following rectangle. From the point of intersection of these two lines a perpendicular is drawn on the horizontal axis. The foot of the perpendicular indicates the Mode. This is read from the horizontal scale and the modal value is found to be 256 (in ₹) approximately.

# Profits (₹)

## 2. Frequency Polygon and Frequency Curve

i)

In this method, the frequency of each class is plotted against the mid-value of the corresponding class. The points thus obtained are joined successively by straight lines. The polygon is then completed by joining two end-points to the mid-values of two empty classes assumed in either side of the frequency distribution.

ii) Frequency polygon can be obtained from the histogram by joining the successive

mid-points of the top of the rectangles which constitute the histogram and the polygon is completed in the same manner as before.

- iii) If in a frequency distribution the widths of the classes are reduced, then the number of classes will increase. As a result the vertices of a frequency polygon will come very close to each other. In that case, if we join the points by smooth free hand line instead of straight lines, a smooth curve is obtained which is known as a Frequency Curve.
- iv) Frequency Curve is a limiting curve case of frequency polygon.

# 3. Cumulative Frequency Polygon / Ogive Curve

- 1. It is a graphical representation of cumulative frequency distribution.
- 2. Median and all other partition values are calculated from ogives.
- 3. There are two types of ogives (i) Less Than Ogive (ii) More Than Ogive.
- 4. IN LESS THAN OGIVE LESS THAN CUMULATIVE FREQUENCIES ARE USED.
  AND IN CASE OF MORE THAN OGIVE, MORE THAN CUMULATIVE FREQUENCIES
  ARE USED AND THE OGIVE CURVE LOOKS LIKE ELONGATED "S". THESE ARE ALSO
  KNOWN AS "S" CURVE.

# Example

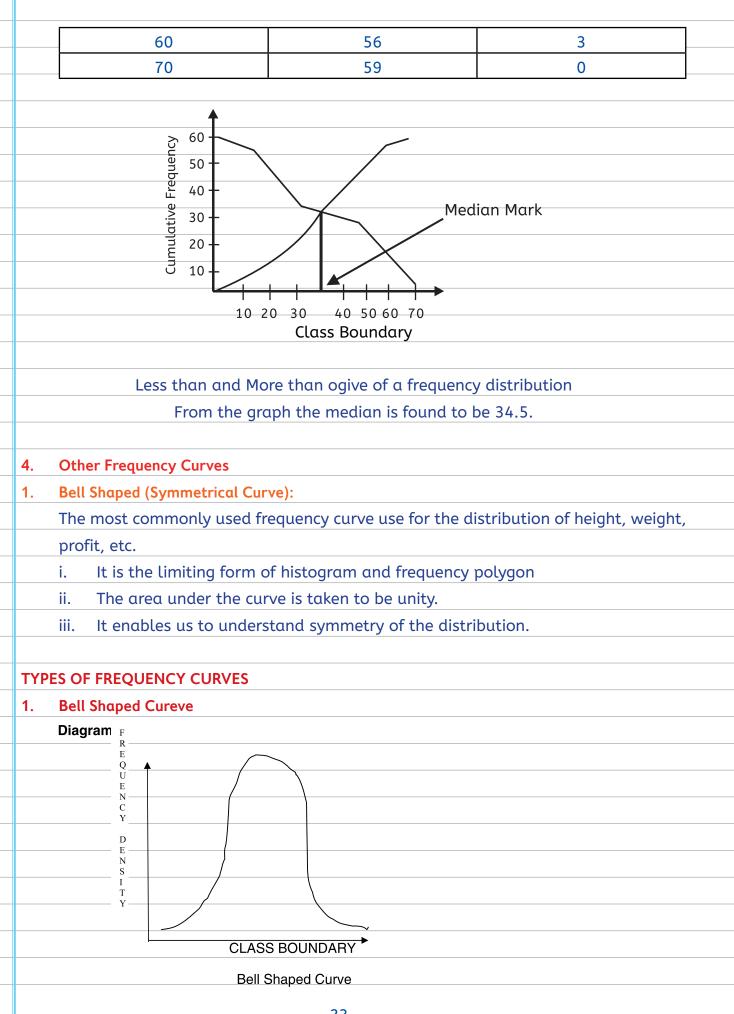

Draw the cumulative frequency diagram (both more-than and less-than ogive) of

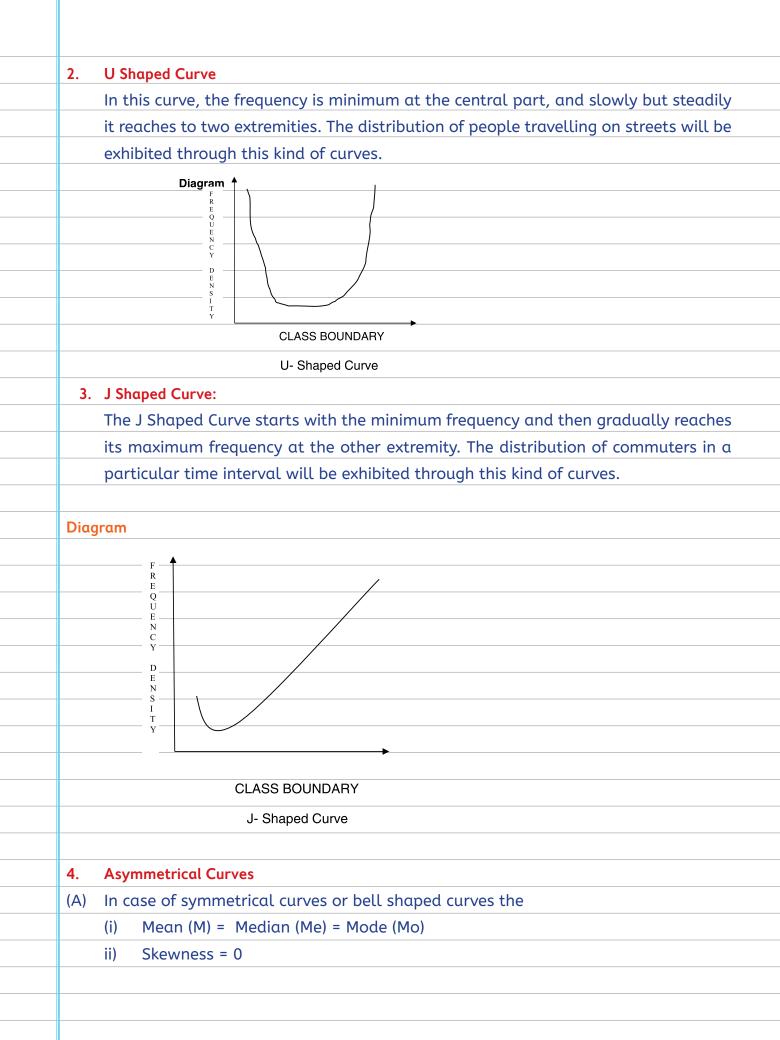

| the following fre | quency | distributi | ion and | locate gi | raphicall | y the Me | edian: |
|-------------------|--------|------------|---------|-----------|-----------|----------|--------|
|                   |        |            |         |           |           |          |        |

| 50. | The chart that uses logarithm of the variable | is known as :                        |
|-----|---|--------------------------------------|
|     | a) Multiple line chart                        | b) Ratio chart                       |
|     | c) Line chart                                 | d) Component line chart.             |
|     |   |                                      |
| 51. | Multiple axis line chart is considered when   |                                      |
|     | a) the units of the variables are different.  |                                      |
|     | b) there is more than one time series         |                                      |
|     | c) both a) and b) above                       |                                      |
|     | d) either a) or b) above                      |                                      |
|     |   |                                      |
| 52. | The graphical representation of a cumulative  | frequency distribution is called     |
|     | a) histogram                                  | b) ogive                             |
|     | c) both a) and b) above                       | d) none of the above                 |
|     |   |                                      |
| 53. | Ogive is a                                    |                                      |
|     | a) line diagram                               | b) bar diagram                       |
|     | c) both a) and b) above                       | d) none of these                     |
|     |   |                                      |
| 54. | The most common form of diagrammatic re       | epresentation of a grouped frequency |
|     | distribution is :                             |                                      |
|     | a) ogive                                      | b) histogram                         |
|     | c) frequency polygon                          | d) none of the above                 |
|     |   |                                      |
| 55. | Frequency density is used in the construction |                                      |
|     | a) histogram                                  | b) frequency polygon                 |
|     | c) ogive                                      | d) none of the above                 |
|     |   |                                      |
| 56. | When the width of all classes is same, freque | ncy polygon has not the same area as |
|     | the Histogram :                               |                                      |
|     | a) true                                       | b) false                             |
|     | c) both a) and b) above                       | d) none of the above                 |
|     |   |                                      |
| 57. | Diagrammatic representation of the cumulat    | · · ·                                |
|     | a) frequency polygon                          | b) ogive                             |
|     | c) histogram                                  | d) none of the above                 |
|     |   |                                      |
|     |   |                                      |

| 58. | A comparison among the class frequence   | ies is possible in                          |
|-----|--|---|
|     | a) ogive                                 | b) histogram                                |
|     | c) frequency polygon                     | d) either b) or c) above                    |
|     |  |   |
| 59. | Mode is found graphically by :           |   |
|     | a) frequency polygon                     | b) ogive                                    |
|     | c) histogram                             | d) none of the above                        |
|     |  |   |
| 60. | Frequency curve is a limiting form of    |   |
|     | a) frequency polygon                     | b) histogram                                |
|     | c) either a) or b) above                 | d) both a) and b) above                     |
|     |  |   |
| 61. | The breadth of the rectangle is equal to | the length of the class-interval in         |
|     | a) ogive                                 | b) histogram                                |
|     | c) both a) and b) above                  | d) none of these.                           |
|     |  |   |
| 62. | Consecutive rectangles in a Histogram h  | ave no space in between them.               |
|     | a) true                                  | b) false                                    |
|     | c) both a) and b) above                  | d) none of the above                        |
|     |  |   |
| 63. | Median of a distribution can be obtained | d from                                      |
|     | a) histogram                             | b) frequency polygon                        |
|     | c) Ogives                                | d) none of the above                        |
|     |  |   |
| 64. | The curve obtained by joining the points | s, whose x-coordinates are the upper limits |
|     | of the class-intervals and y-coordinate  | s are corresponding cumulative frequencies  |
|     | is called                                |   |
|     | a) ogive                                 | b) frequency polygon                        |
|     | c) histogram                             | d) frequency curve                          |
|     |  |   |
| 65. | The purpose served by diagrams and ch    | arts is:                                    |
|     | a) To avoid tabulation                   | b) To avoid textual form                    |
|     | c) Simple presentation of data           | d) All of the above                         |
|     |  |   |
| 66. | Less than type and more than type ogiv   |   |
|     | a) Mean b) Median c) Mod                 | e d) Quartile                               |
|     |  |   |

| 67.     | If we plot l  | ess than and m     | nore than type freque      | ency distribu | ution, then the graph |  |
|---------|---|--------------------|----------------------------|---------------|-----------------------|--|
|         | plotted is:   |                    |                            |               |                       |  |
|         | a) Frequency  | y Curve            |                            | b) Histog     | ram                   |  |
|         | c) Ogive  |                    |                            | d) None d     | of these              |  |
|         |   |                    |                            |               |                       |  |
| 68.     | From which  | graphical repres   | sentation, we can calc     | ulate partit  | ion values?           |  |
| <br>    | a) Lorenz Cu  | irve               |                            | b) Ogive      | Curve                 |  |
| <br>    | c) Histogram  | า                  |                            | d) None d     | of these              |  |
| <br>    |   |                    |                            |               |                       |  |
| <br>69. | When the tw   | vo curves of ogiv  | ve intersect, the point    | of intersecti | on provides:          |  |
| <br>    | a) First Quai   | rtile              |                            | b) Third C    | Juartile              |  |
| <br>    | a) Frequency Curve b) Histogram<br>c) Ogive d) None of these<br>68. From which graphical representation, we can calculate partition values?<br>a) Lorenz Curve b) Ogive Curve<br>c) Histogram d) None of these<br>69. When the two curves of ogive intersect, the point of intersection provides:<br>a) First Quartile b) Third Quartile<br>c) Second Quartile d) None of these |                    |                            |               |                       |  |

|      |      | FREQUENCY DISTRIBUTION  |
|------|------|---|
| 1.   | Tab  | ular representation of statistical data is usually made in ascending order of       |
|      | mag  | gnitude relating to measurable characteristics according to individual value or     |
|      | grou | up of values.   |
|      |      |   |
| 2.   | The  | re are two types of frequency distribution  |
|      | i.   | For discrete variable it is known as simple or ungrouped or discrete frequency      |
|      |      | distribution.   |
|      | ii.  | For continuous random variable it is known as continuous or grouped frequency       |
|      |      | distribution.   |
|      |      |   |
| 3.   | SON  | 1E IMPORTANT TERMS  |
|      | i)   | Frequency : (Tally Mark)  |
|      |      | Frequency of a value of variable is the number of times it occurs in a given        |
|      |      | series of observations. A Tally Mark ( / ) is put against the value when it occurs  |
|      |      | in the raw data. Having occurred four times, the fifth occurrence is represented    |
|      |      | by putting a Cross Tally Mark ( \ ) on the first four tally marks.                  |
|      | ii)  | <b>Range :</b> Range of a given data is the difference between the largest measure  |
|      |      | and the smallest measure in a given set of observations.                            |
|      |      |   |
|      | iii) | Class Interval (or class) : A large number of observations having wide range, is    |
|      |      | usually classified into number of groups. Each of these groups is known as a class. |
| <br> |      |   |
|      | iv)  | Class frequency, Total Frequency : The number of observations which is class        |
|      |      | contains, is known as its class frequency. The total number of observations in      |
|      |      | the frequency distribution is known as 'Total Frequency'.                           |
|      |      | Charles the two and of a class interval are luceum as class limits of that          |
|      | v)   | Class Limit : The two ends of a class interval are known as class limits of that    |
|      |      | class. The smaller of the two ends is called LOWER Class Limits and the greater     |
| <br> |      | is called Upper Class Limit. These classification are called non-overlapping or     |
|      |      | mutually inclusive classification.  |
|      |      | Class Reundarias (M/bon up consider a continuous unrights, the charmeticar and      |
|      | vi)  | Class Boundaries : When we consider a continuous variable, the observation are      |
|      |      | recorded nearest to a certain unit. For example, let us consider the distribution   |
|      |      | of weight of a group of persons. If we measure the weight nearest to the pound,     |
|      |      | then a class interval like (100-109) will include all the observations between      |

99.5 lb to 109.5 lb. Similarly, all the observations between 109.5 lb to 119.5 lb will be included in the class interval (110- 119). For the class interval (100-109), 99.5 is the lower class-boundary and 109.5 is the upper class boundary. For the class (110-119), the lower and upper class boundary respectively 109.5 and 119.5. These classifications are called overlapping or mutually exclusive classification.

Class boundaries can be calculated from the class limits by the following rule:

Lower Class boundary = Lower Class limit -  $\frac{1}{2}$ d;

Upper Class boundary = Upper Class limit +  $\frac{1}{2}$ d;

where, d is the common difference between the upper limit of a class and the lower limit of the next class. d/2 is called the Correction Factor

vii) Mid-value ( or class mark or mid point or class point) :

Mid-value is the mid-Point of the class interval and is given by Class Mark= $\frac{UCL+LCL}{2} = \frac{UCB+LCB}{2}$ 

viii) Width or Size : This is the length of a class and is obtained by the difference between the upper and lower class boundaries of that class.

Class width / size = Difference between 2 successive LCL's / UCL's

- = Difference between 2 successive LCB's / UCB's
- = Difference between 2 successive mid values if all the class are of the same width.
- = Difference between UCB and LCB
  - **Note** : Class width  $\neq$  UCL-LCL

ix) **Frequency Density** : This is defined as the frequency per unit width of the class.

Frequency Density = Class frequency Class width

It measures the concentration of the frequency of different classes.

|      |  | he class frequency to the total frequency, |
|------|--|--|
|      | i.e. Relative frequency = <u>Class</u> frequer                 |  |
|      | Total Frequen  | су   |
|      | Relative Frequency of any class li                             | es between 0 and 1                         |
|      |  |  |
|      | xi) Percentage Frequency :                                     |  |
|      | Class frequency<br>Total Frequency x100 = or Relative frequenc | y × 100                                    |
|      |  |  |
|      | CUMULATIVE FREQUENC  | Y DISTRIBUTION                             |
| 1.   | There is another type of frequency distrib                     | ution known as Cumulative Frequency        |
|      | Distribution where the frequencies are cum                     | ulated.                                    |
|      |  |  |
| 2.   | This distribution is prepared from the group                   | ped frequency distribution by taking the   |
|      | end values (ie. class boundaries and not cla                   | ass limits)                                |
|      |  |  |
|      |  |  |
| 3.   | Number of observation less than or equal t                     | o the class boundaries are called "Less-   |
|      | Than" Type Cumulative Frequency Distribut                      | ion.                                       |
|      |  |  |
| 4.   | Number of observation greater than or equa                     | al to class boundaries are called " More-  |
|      | Than" Type Cumulative Frequency Distribut                      | ion.                                       |
|      |  |  |
| 5.   | It can be made both for discrete series i.e.                   | ungrouped data as well as for grouped      |
|      | data.  |  |
|      |  |  |

# Cumulative Frequency Distribution of weights of 60 students

| Class Boundaries<br>(Weight in kg) | Cumulative | e Frequency |
|------------------------------------|------------|-------------|
|                                    | Less Than  | More Than   |
| 30-34                              | 3          | 60          |
| 35-39                              | 8          | 57          |
| 40-44                              | 20         | 52          |
| 45-49                              | 38         | 40          |
| 50-54                              | 52         | 22          |
| 55-59                              | 58         | 8           |
| 60-64                              | 60         | 2           |

Here the less than cumulative frequency of the second class is 8. This implies that there are 8 students whose weights are less than 39.5 kg (the upper boundary of that class). The more than cumulative frequency of the second class is 57, i.e. there are 57 students whose weights are more than 34.5 kg(the lower boundary of that class).

Numerical Problems

In 1995, out of the 2,000 students in a college; 1,400 were for graduation and the rest of Post-Graduation (PG). Out of 1,400 Graduate students 100 were girls, in all there were 600 girls in the college. In 2000, number of graduate students increased to 1,700 out of which 250 were girls, but the number of PG students fall to 500 of which only 50 were boys. In 2005, out of 800 girls 650 were for graduation, whereas the total number of graduates was 2,200. The number of boys and girls in PG classes were equal.

97. Present the above information in tabular form.

98. Calculate the percentage increase in the number of graduate students in 2005 as compared to 1995.

99. Out of 1000 persons, 25% were industrial workers and the rest were agricultural workers. 300 persons enjoyed world cup matches on TV. 30% of the people who had not watched world cup matches were industrial workers. What is the number of agricultural workers who had enjoyed world cup matches on TV?
a) 230
b) 240
c) 250
d) 260

100. The class marks of a distribution are: 26, 31, 36, 41, 46, 51, 56, 61, 66, 71. Find the true class limits.

 101. When the class intervals are 10 - 19, 20 - 29, 30 - 39, ....... Upper class boundaries

 (UCB) and the Upper class limits (UCL) of the 2<sup>nd</sup> class interval are:

 a) 29, 29
 b) 20, 29
 c) 29.5, 29.5
 d) 29.5, 29

102. The class mark of the Class Intervals: 10 - 20, 20 - 30, 30 - 40, are:a) 15, 25, 35b) 14.5, 24.5, 34.5c) 30, 50, 70d) None of the above

103. From the following data find the number of class intervals, if class length is given as 5: 73, 72, 65, 41, 54, 80, 50, 46, 49, 53 a) 5 b) 6 c) 7 d) 8

| 104. The marks obtained   | d by 30 stud   | ents in a cla  | ss test, out o  | of 50 marks, acc  | ording to   |
|---------------------------|----------------|----------------|-----------------|-------------------|-------------|
| their roll numbers a      | re: 41, 25, 3  | 3, 12, 21, 19  | , 39, 19, 21,   | 12, 1, 19, 17, 12 | 2, 19, 17,  |

|    |                 |               |                |                |                |             |

## HOMEWORK SOLUTION

- (d) Telephonic interview method is considered as the quickest method to collect primary data as the relevant information can be gathered by the researcher himself by contacting the interviewer over the phone without any time log.
- (b) According to the History of Statistics we can see that one school of thought is of the view that statistics is derived from the Italian word 'Statist'.
- 3. (b) No. of persons earning more than ₹ 2500 = 20 + 25 = 45
  - $\therefore$  The percentage of persons earning more than

₹ 2,500 =  $\frac{45}{90}$  × 100 = 50%

- 4. (d) The source of data, if any, in any kind to tabulation is shown in the footnote.
- 5. (c) Divided Bar Chart, also known as percentage Bar Diagrams, is good for both the things i.e. for comparing different components of a variable as well as the relating of the different components to the whole.
- 6. (b) Relative frequency of a class interval is defined as the ratio of the class frequency to the total frequency. Therefore, Relative frequency for a particular class lies between 0 and 1 both inclusive.
- 7. (a) The number of observation which are more than 350 in inclusive of those observation which are more than 400 and 450.

∴ Deducting those number of observations which are more than 400 and 450 from the number of observations which are 350, we will get the number of observations lying between 350 and 400.

So, the number of observations lying between 350 and 400 = 25 - 12 - 0 = 13

 (a) When the width of all classes is same frequency, polygon has the same area as the histogram.

| 9.  | (b) The graphical representation of a cumulative frequency distribution is called          |
|-----|--|
|     | Ogive. i.e. by plotting the cumulative frequency against the respective class              |
|     | boundary, we get olives which can be less than type ogive are these than type olives       |
|     | depending upon the type of cumulative frequency distribution.                              |
|     |  |
| 10. | (c) A table has five parts namely.   |
|     | (i) Stub   |
|     | (ii) Caption   |
|     | (iii) Body   |
|     | (iv) Box head  |
|     | (v) Title  |
|     |  |
| 11. | (d) Total components of the cost of sugar  |
|     | = (12 + 20 + 35 + 23) units  |
|     | = 90 units   |
|     | Largest component of cost of sugar   |
|     | = 35 units   |
|     | 12   |
|     | i.e. $\frac{12}{90} \times 360^\circ = 140$  |
|     | Smallest component of cost of sugar  |
|     | = 12 units   |
|     | 12   |
|     | i.e. $\frac{12}{90} \times 360^\circ = 48^\circ$   |
|     | $\therefore$ Difference between the central angles for the largest and smallest components |
|     | of the cost of sugar   |
|     | $= 140^{\circ} - 48^{\circ} = 92^{\circ}$  |
|     |  |
| 12. | (b) Frequency density of a class interval is defined as the ratio of the frequency of      |
|     | that class interval to the corresponding class length.                                     |
|     |  |
| 13. | (c) Multiple Bar Chart also known as Grouped Bar Chart is one dimensional diagram          |
|     | in which two or more bars adjoining each other are constructed to represent the            |
|     | values of different variables or the values of various components of the same              |
|     | variable.  |
|     | Multiple Bar Chart or Grouped Bar Chart is considered to compare two or more               |
|     | related series.  |
|     |  |

- 14. (a) Histogram is a graph that represents the class frequencies in a frequency distribution by vertical adjacent rectangles. A Histogram is two-dimensional, i.e. a histogram comprises of both length as well as the width. As the Product of length and width indicates the area. Therefore Histogram is referred to as an Area Diagram. Its area represents the total frequency as distributed through the classes.
- 15. (c) Most extreme values which would be ever included in a class-interval are called as class boundaries, also referred to as actual class limit, are defined as the limits up to which the two limits, (actual) of each class may be extended to fill up the gap that exist between the classes.
- 16. (d) Title: Sex distribution of Trade Union and Non-union members.

|---|------------|------|--------|-------|------|--------|-------|
| 1 | Category   | Male | Female | Total | Male | Female | Total |
| 1 | Member     | 1175 | 25     | 1200  | 1508 | 292    | 1800  |
| 1 | Non-member | 375  | 175    | 550   | 42   | 8      | 50    |
| 1 | Total      | 1550 | 200    | 1750  | 1550 | 300    | 185   |

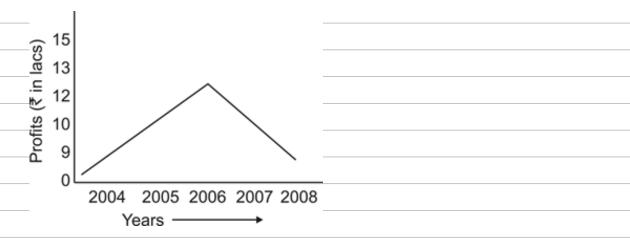

Required ratio of female members of the trade union is 2000 : 2004 = 25 : 292.

17. (b) Lower class Boundary

Lower class limit  $-\frac{1}{2}$  (upper class limit to the class – lower class limit to the succeeding class). Therefore, lower class boundary is a lower limit to lower class limit.

18. (c) The bell-shaped curve looks like a bell. On a bell-shape curve, the frequency,
starting from a rather low value, gradually reaches the maximum value, somewhere
near the central part and then gradually decreases to reach is lowest value at the
other extremity. Similar is the case of profits of a company. It rises till the resources
are fully utilized and if the resources are still utilized then due to over-utilization of
resources, the profits start declining. This can be clearly depicted through the data
given below:

| Year | Profits (` in lacs) |  |
|------|---------------------|--|
| 2004 | 10                  |  |
| 2005 | 12                  |  |
| 2006 | 15                  |  |
| 2007 | 13                  |  |
| 2008 | 9                   |  |

19. (d)

| Category             | T.V. | NTV | Total |  |
|----------------------|------|-----|-------|--|
| Agricultural workers | 260  | 490 | 750   |  |
| Industrial workers   | 40   | 210 | 250   |  |
| Total                | 300  | 700 | 1000  |  |

Therefore, number of agricultural workers who had enjoyed world cup matches on T.V. = 260.

20. (c) Ogives are considered for obtaining quartiles graphically. If a perpendicular is drawn from the point of intersection of the two o-gives, i.e. less than type ogive and more than type give, on the horizontal axis, then x-value of this point gives us the value of median, the second or middle quartile.

- 21. (b) Indirect oral investigation is a method in which a third person is contacted who
  is expected to know the necessary details about the persons for whom the enquiry
  is meant. This method is suitable when it is not possible or deliverable to approach
  informant directly.
- 22. (b) Circular diagram is a Two-dimensions diagram in which a circle is prepared and the radius of circle is determined on the basis of minimum square root value of the variable. Two-dimensional diagram is a diagram which is prepared on the basis of two dimension i.e. length and width.
- 23. (d) Each column is given a heading to explain what the figures in the columns represent. These column headings of a table are known as caption.
- 24. (a) The Government source like Indian trade journal weekly, reserve Bank of Indian Bulletin – monthly, etc and International sources like WHO, World Bank, IMF, etc are some of the important sources of secondary data.
- 25. (d) We have, Range = Maximum value Minimum value = 80 41 = 39 Class length = 5

No. of class Intervals × class lengths Range

 $\implies$  No. of class Intervals  $\times$  5  $\cong$  39

 $\implies$  No. of class Intervals =  $\frac{39}{5}$ 

(We always take the next integer as the no. of class intervals so as to include both the minimum and maximum values).

- 26. (b) Pie diagram
- 27. (b) Option (b) represents statistical data which can be understood by referring the definition of statistics keeping note of the following points.
  - 1. Statistics are aggregate of facts. A single figure cannot be called as statistics because it cannot be compared to draw any conclusion out of it.
  - 2. All statistical facts are expressed in numbers. Qualitative expressions like young, old, etc do not constitute statistics.
  - Statistics should be placed in relation to each other so as to facilitate comparison.
     For this purpose, the data must be homogenous and not heterogenous. e.g.
     height and weight are heterogenous in character.

| 28.  | (c) Given data represents unclassified and ungrouped data. Therefore, the given       |
|------|---|
|      | series is an individual series.   |
|      |   |
| 29.  | (c) Mid-values are also called class mark.  |
|      | Lower class limit + Upper class limit   |
|      | Class Mark = 2  |
|      |   |
| 30.  | (a) Line Diagram.   |
|      |   |
| 31.  | (b) By plotting cumulative frequency against the respective class boundary, we        |
|      | get Ogives. There are two type of ogives:   |
|      | (i) Less than type ogive.   |
|      | (ii) More than type ogive.  |
|      | Olives may be considered for obtaining quartiles graphically. If a perpendicular is   |
|      | drawn from the point of intersection of two ogives on the horizontal axis, then       |
|      | then the x-value of this point gives us the value of median, the second or middle     |
|      | quartile.   |
|      | Therefore, the meeting point of less than type ogive and more than type ogive is      |
| l    | known as 'Median'.  |
|      |   |
| 32.  | (a) Bar diagram is one dimensional.   |
|      | Cube diagram has 3 dimensions viz. length, breadth and height and hence is three-     |
|      | dimensional.  |
|      | Pie-diagram is two-dimensional.   |
| -    | Therefore, if we arrange it in sequence, we get:                                      |
| -    | Bar diagram, cube-diagram and Pie diagram i.e. 1, 3, 2.                               |
| <br> |   |
| 33.  | (c) Histogram is used to find Mode. [Self Explanatory]                                |
|      |   |
| 34.  | (b) A qualitative characteristic is known as an attribute.                            |
|      | So the nationality of a person is an attribute as it is a qualitative characteristic. |
| <br> |   |
| 35.  | (c) If we plot less than and more than type frequency distribution, then the graph    |
|      | plotted is Ogive.   |
|      | Ogive are of two types - Less than type ogive and more than type ogive. [self-        |
|      | explanatory]  |
|      |   |

| 36.  | (d)  | Requisites of a good classification are:   |
|------|------|--|
|      | 1.   | It should be exhaustive  |
|      | 2.   | It should be mutually exclusive  |
|      | 3.   | It should be unambiguous   |
|      | 4.   | It should be stable and flexible   |
|      | 5.   | It should be homogeneous   |
|      | 6.   | It should be a revealing classification  |
|      |      |  |
| 37.  | (c)  | Olives are considered for obtaining quartiles graphically. If a perpendicular is   |
|      | drav | wn from point of intersection of two Olives on horizontal axis, then x-value of  |
|      | this | point gives us the value of median (2nd or middle quartile).   |
|      |      |  |
| 38.  | (b)  | Mode can be obtained from histogram.   |
|      |      |  |
| 39.  | (b)  | Secondary data   |
|      |      |  |
| 40.  | (c)  | Statistic  |
|      |      |  |
| 41.  |      | We know, that the two curves viz. Less than Ogive & More than Ogive intersect  |
|      | at a | i point called Median or we can say Second Quartile.   |
|      |      |  |
| 42.  | (c)  | Chronological Classification data are classified on the basis of 'Time'.   |
|      |      |  |
| 43.  | (d)  | Pie-Diagram: Two Dimensional Diagram (2)   |
| <br> |      | se Diagrams are also called as "Area-Diagrams".  |
|      |      | d when different segments or components of values are also to be presented.  |
| <br> |      | -Diagram: One Dimensional Diagram (1) means such diagrams where only one   |
|      |      | ensional measurement i.e. height is used. There is no importance of width or   |
|      | thic | kness in these diagrams. The heights of bars are taken on the basis of values.   |
|      |      | in Dimensional Dimension |
|      |      | ic-Diagram: Three Dimensional Diagram (3) are those in which three dimensions  |
|      |      | ength, breadth & height are taken into account used when these is wide range   |
|      |      | ata and three different but inter-related features of data are to be represented   |
|      | sim  | ultaneously.   |
|      |      |  |

| (c)<br>Class<br>0-10<br>10-20<br>20-30<br>30-40<br>40-50<br>(a) The median is calcula | Cumulative Fre<br>5<br>13<br>28<br>34<br>38<br>ted by Ogive Curve  | q.Frequency $5$ $13 - 5 = 8$ $28 - 13 = 15$ $34 - 28 = 6$ $38 - 34 = 4$   |  |

- 69. (b) Data collected on religion from the census reports are secondary data.
- 70. (d) Personal interview method and telephone interview method are the interview method.

71. (c) Profit made by XYZ Bank is different years refer to a continuous variable.

- 72. (d) Mode of presentation data are textual presentation and tabulation.
- 73. (a) If the data represent cost spent on conducting an examination under various heads then the most suitable diagram will be Pie diagram.
- 74. (c) The point of intersection of less than Ogive and greater than Ogive curve gives us Median.
- 75. (d) 'Stub' of a table is the left part of the table describing the rows.

76. (a) Frequency density is used in the construction of Histogram.

- 77. (d) Divided Bar Chart is considered for comparing different components of a variable and the relation of different components to the table.
- 78. (b) Discrete distribution

79. (c) Histogram is useful to determine graphically the value of 'mode'.

- 80. (a) Data are said to be Primary data if the Investigator himself is responsible for the collection of the data.
- 81. (a) A suitable graph for representating the portioning of total into sub parts in statistics is a Pie chart.
- 82. (b) The number of times a particular items occurs in a Class Interval is called its Frequency.

## 83. (a) An Ogive is a graphical representation of cumulative frequency distribution.

| 34. <u>(</u> c) |                           |                               |              |
