} 20 marks

Meaning of Statistics

When defined in Plural sense -

Data collection for some specific purpose.

When defined in Singular sense -

Science
or
Process of collection, presentation
& analysis of data

What topics we are going to cover

- **Collection of Data** ✓
- **Presentation of Data** ✓
- **Present Data Graphically** ✓

What is Statistics

Statistics is derived from -

Latin word 'status',

→ American

Italian word 'statista'

→ Art

German word 'statistik'

→ Strict

French word 'statistique'

→ Exacte

10 att. → 2 bar.

⊙ Statistics is derived

It

× Cre → Status

Application of Statistics

Every field where you need to understand and analyze data is an application of statistics.

That's why we will limit ourselves to only field related to commerce i.e.,

Economics

Business Management

Commerce and Industry

Limitations of Statistics

- (1) Study of Quantitative data only:** - Statistics studies only such facts as can be expressed in numerical terms. It does not study qualitative phenomena like honesty, friendship, wisdom, health, patriotism, justice, etc. *→ numbers*
- (2) Study of Aggregates only:** - Statistics studies only the aggregates of quantitative facts. It does not study statistical facts relating to any particular.
- (3) Homogeneity of Data, an essential Requirement:** - To compare data, it is essential that statistics are uniform in quality. Data of diverse qualities and kinds cannot be compared. *→ ek type ka*
- (4) Results may Prove to be Wrong:** - Future projections of sales, production, price and quantity etc. are possible under a specific set of conditions.
- (5) Can be used only by the Experts:** - If we do sampling and the rules for random sampling are not strictly adhered to, the conclusion drawn on the basis of these unrepresentative samples would be erroneous.

Collection of Data

1. On the nature of data, we can define data as -

Quantitative Data - *numeric data* - No. of acc. on road, height, weight etc.
Cardinal Data

Qualitative Data - *honesty, beauty, bravery, etc.* → Characteristic which is measurable
→ attribute: - Ranking/Scaling

Qualitative information can be used in statistics by converting it to quantitative information by providing a numeric description to the given characteristic. For example - putting it on scale or ranking system

Variable

→ vary able } Quantitative data

Discrete Variable:-

When variable taken is countable, then it is called as discrete variable

Example : Money in an account, No. of shares of company

Continuous Variable:-

When variable can obtain any value from the given interval.

Example : Height, weight etc.

179-180

180cm
179.68cm

179.682cm
[92-93]kg

On the Basis of Source of Data

Primary Data: - Data collected by the investigator for his own purpose, for the first time, from beginning to end, are called primary data.

- These are collected from the source of origin.
 - Data, originally collected in the process of investigation are known as primary data.
-
- Interview method
 - Mailed questionnaire method
 - Observation method
 - Questionnaires filled and sent by enumerators.

Interview Method

- Direct Interview Method or Personal Interview Method

E.g. – Natural Calamity

- Indirect Interview Method

E.g. – Railway accident

- Telephonic Interview Method

Fastest interview method with maximum non responses and less accurate

Mailed Questionnaire Method

No. of responses is very low

Google-form

- Under this method, questionnaires are mailed to the informants. A letter is attached with the questionnaire giving the purpose enquiry. The informant notes the answers against the questionnaires and returns the completed questionnaire to the investigator.
- Although a wide area can be covered using the mailed questionnaire method, the number of non-responses is likely to be maximum in this method

Observation Method

- PT I teacher

Direct information is collected by taking the observation by the observer.

Although this is likely to be the best method for data collection, it is time consuming, laborious and covers only a small area.

Enumerator's Method

→ Aadhar wale Bhai

↳ Aadhar wale

- Under this method, a questionnaire is prepared according to purpose of enquiry.
- To cover the wider range the enumerators are appointed.

This method is very best for wider range but costly in nature

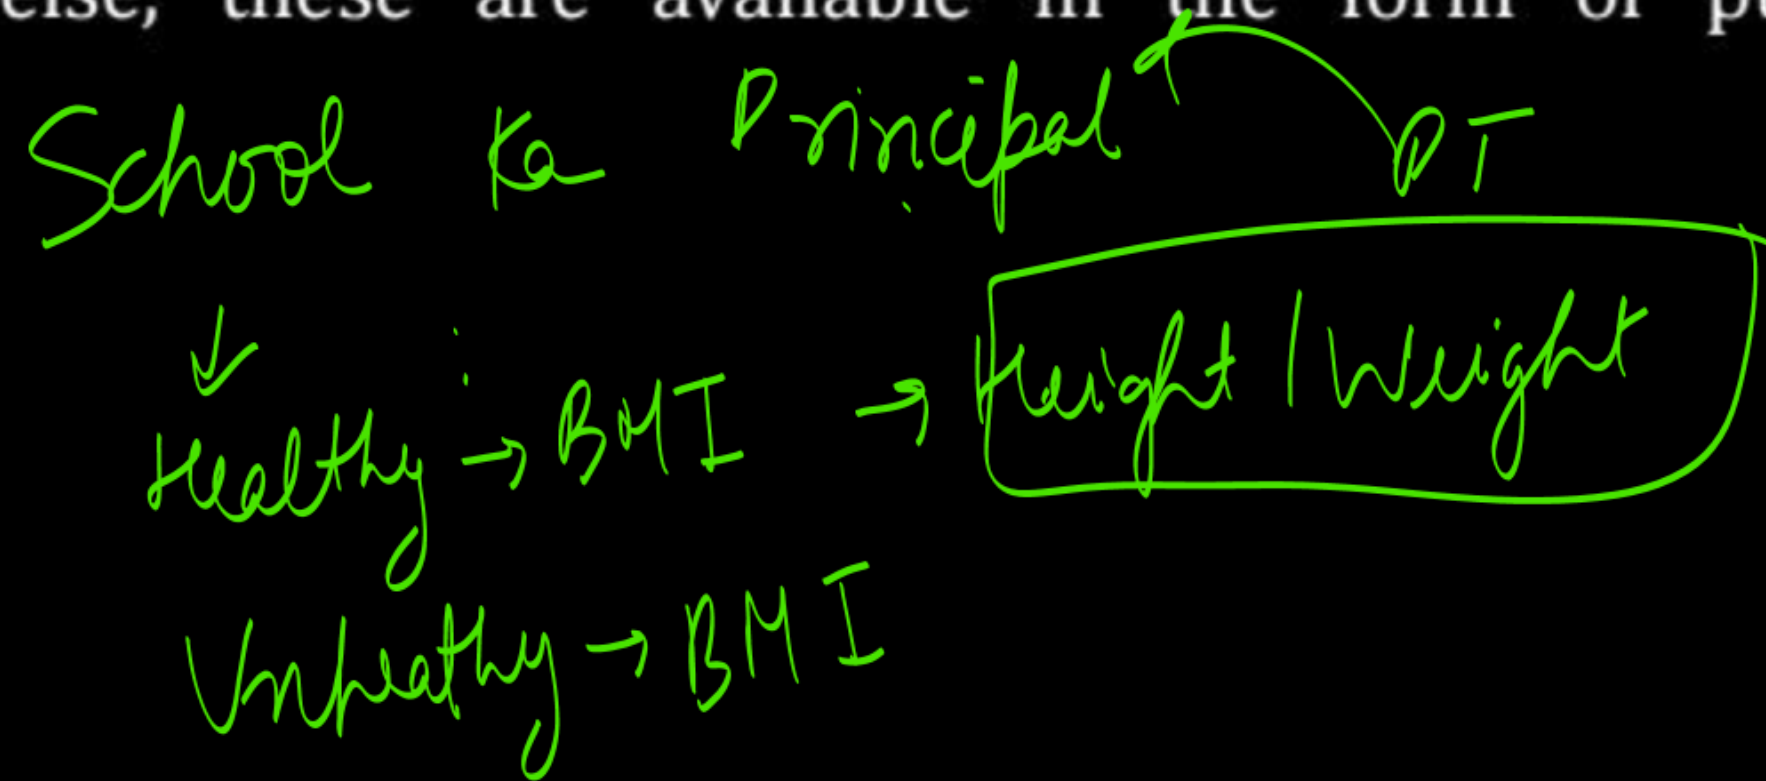

On the Basis of Source of Data

Secondary Data – Secondary data are those which are already in existence, and which have been collected, for some other purpose.

These data are, therefore, called second-hand data. Because data have already been collected by somebody else, these are available in the form of published or unpublished, reports

Sources of Secondary Data

There are many sources of getting secondary data. Some important sources are listed below:

- International sources like WHO, ILO, IMF, World Bank etc.
- Government sources like Statistical Abstract by CSO, Indian Agricultural Statistics by the Ministry of Food and Agriculture and so on.
- Private and quasi-government sources like ISI, ICAR, NCERT etc.
- Unpublished sources of various research institutes, researchers etc

Scrutiny of Data

Checking Accuracy and Consistency

Homogenous

Accuracy :- Relatable multiple
data
Date of Birth Age

Internal Consistency of Data : When two or more related data are present , cross checking can happen

Presentation of Data

- Once the data are collected and verified for their homogeneity and consistency, we need to present them in a neat and condensed form highlighting the essential features of the data.
- Any statistical analysis is dependent on a proper presentation of the data under consideration.
- An important method of organization of data is to distribute these into different classes on the basis of their characteristics. This process is called **classification of data**

Classification of Data or Organising of Data

- It involves conversion of raw data into groups in a manner such that some meaningful conclusions can be drawn out of them.
- Basically, Classification of Data can be defined as the process of arranging data on the basis of characteristics into the number of groups or classes according to the similarity of observations

0 - 100

0-20	5
20-40	6
40-60	8
60-80	10
80-100	3

1 class
2nd class

Data may be Classified as

(i) Data Chronological or Temporal or Time Series: -

Jan - March
April - June
July - Aug
Sep - Dec

(ii) Geographical or Spatial Series Data: -

AN
UE
old city
sector

Data may be classified as

(iii) Qualitative or Ordinal Data: -

Badmash
Kam Badmash
Ache Bache
Bhant ache

(iv) Quantitative or Cardinal Data: -

0-20
20-40
40-60
60-80

Frequency Data

The frequency of a particular data value is the number of times the data value occurs and data in which we can count frequency is called as frequency data

Example:

	No. of things
Bangla	1000 ← Frequency
Swiss Watch	20000
Sports car	100

Non-Frequency Data

Data where the identity of the each of the individual values has to be kept in view are called Non-frequency Type data.

Example:

Car	1
Car	1
Watch	1

There are Generally Three Forms of Presentation of Data

Textual or Descriptive Presentation

Tabular Presentation

Diagrammatic Representation of Data

Textual or Descriptive Presentation

In the textual presentation, data is described by paragraph of text. This method is used in most of the official reports, where the activities, plans or programmes of a project are described in words, inserting relevant facts and figures in between them. When the quantity of data is not too large, this form of presentation is most suitable.

Example:

The Company could not achieve collection efficiency targets during the last five years ending March 2018 as prescribed by HERC and resultantly recoverable amount had increased from ₹ 4,460.18 crore in March 2014 to ₹ 7,332.70 crore in March 2018.

(Paragraph 2.1.10.1)

Chapter III discusses Transaction audit observations which highlight deficiencies in the management of State Government Companies of power sector, which had serious financial implications. Important findings are as under:

Uttar Haryana Bijli Vitran Nigam Limited

- The Company incurred extra expenditure of ₹ 5.34 crore on purchase of transformer oil by resorting to limited tender enquiry instead of open tenders. The Company could not utilise the inventory of ₹ 198.54 crore due to delay in receiving quality test reports from NABL empanelled laboratories. As on 31 March 2018, shortages of ₹ 1.73 crore were pending investigation.

(Paragraph 3.1)

Unpopular

Difficult to interpret

Time consuming

Tabular Presentation

Data is presented in rows and columns. A statistical table is a systematic presentation of data in rows and columns.

Left most part
Defining the rows

FORMAT OF TABLE

Table Number: 1

Title:

(Head Note, if any)

Box head

Stub (Row Heading)	Caption (Column Heading)				Total (Rows)
	Sub-head		Sub-head

Sl. En 2					
St En. 3					
...					
—					
Total (Columns)					

Source Note:

Footnote:

Kg → Kilogram

Diagrammatic Representation of Data

Diagrammatic presentation of data is another useful method of presenting the data in a compact form. There are various kinds of diagrams in common use. But we will have discussion regarding: -

(i) Line Diagram or Historiagram

(ii) Bar Diagram

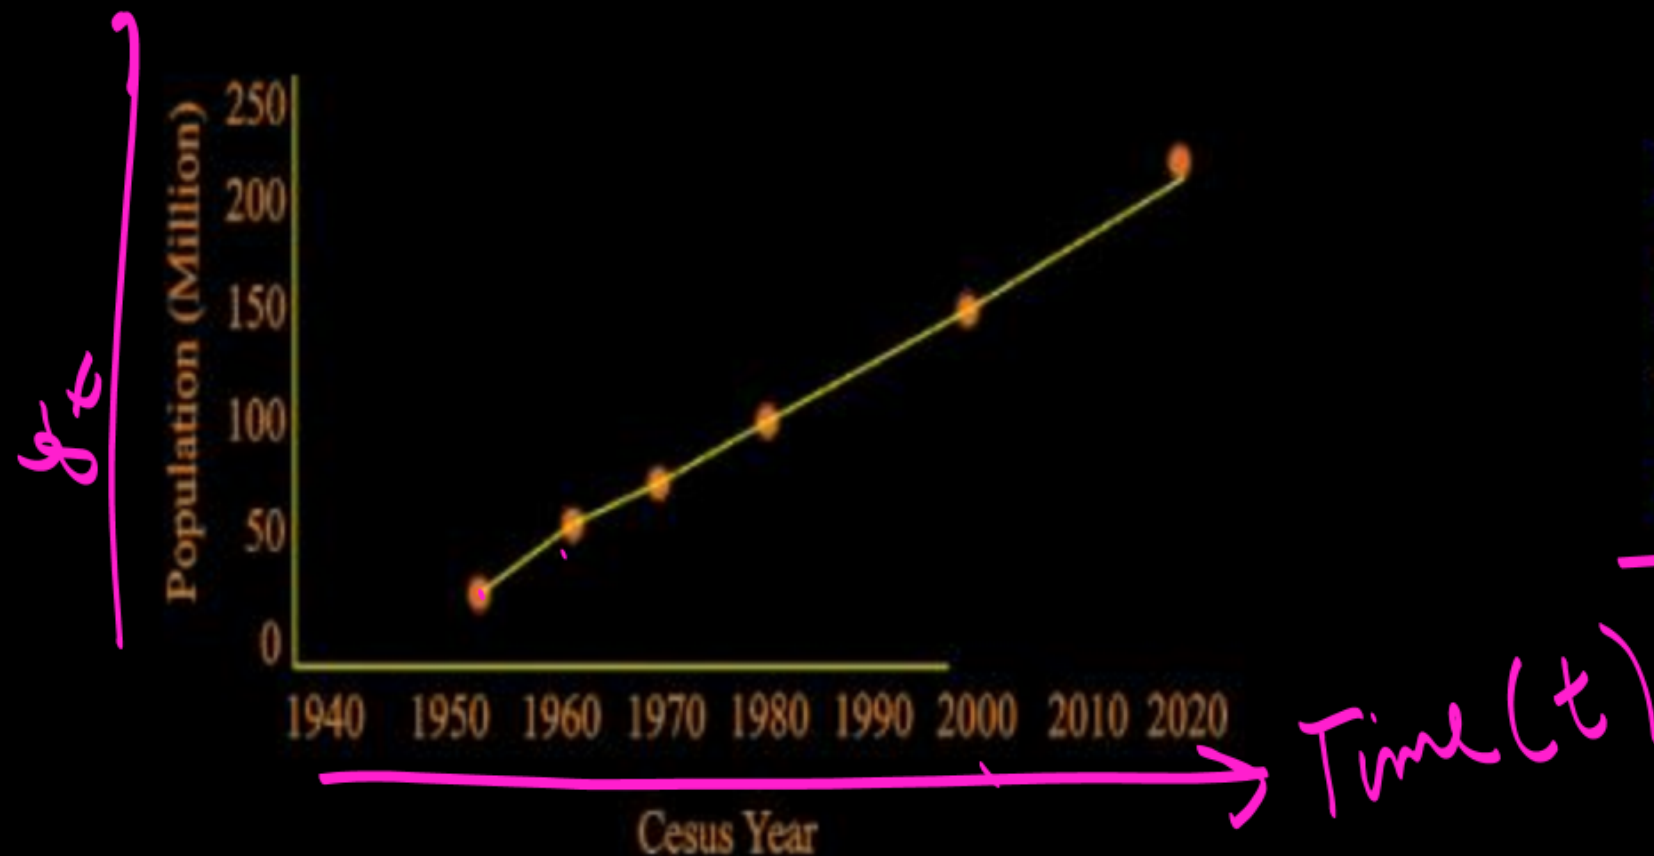

(iii) Pie Chart

Line Diagram or Historiagram

Whenever data vary with time, we use line diagram which is also known as Historiagram. (Generally, used in time series)

- In a simple line diagram, we plot each pair of values of (t, y_t) , y_t representing the time series at the time point t in the $t - y_t$ plane. and then the points are joined

If the fluctuation in data is high, we present the data in form of logarithm vs time known as Log Chart and Ratio Chart

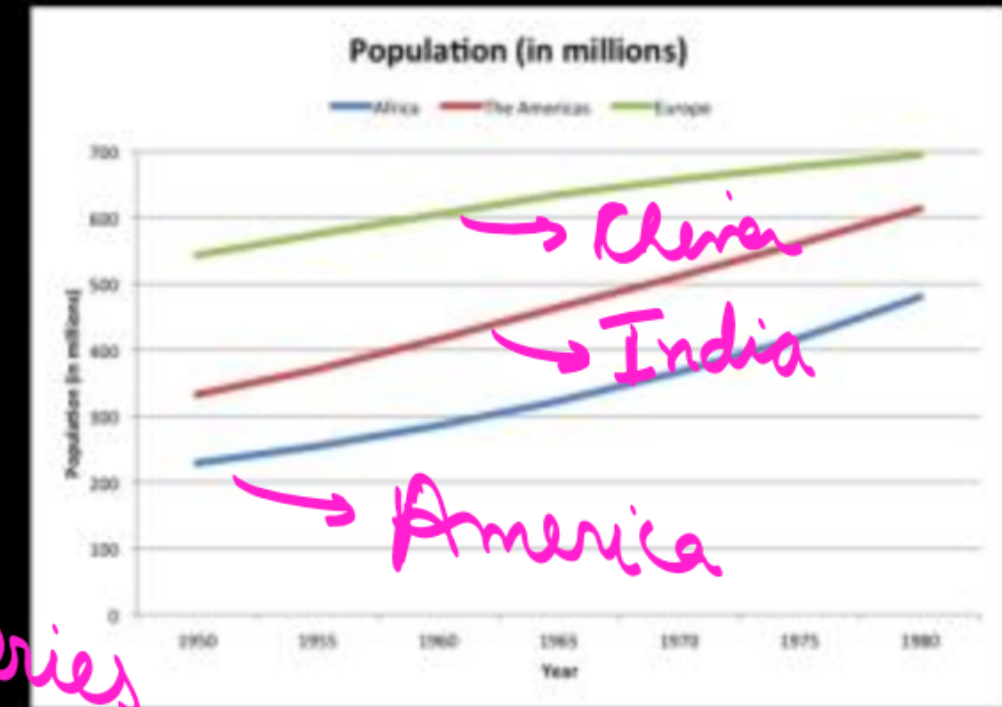

logarithm	
$\log_{10} 10 = 1$	10
3	1000
5	100000
7	10000000
11	10000000000

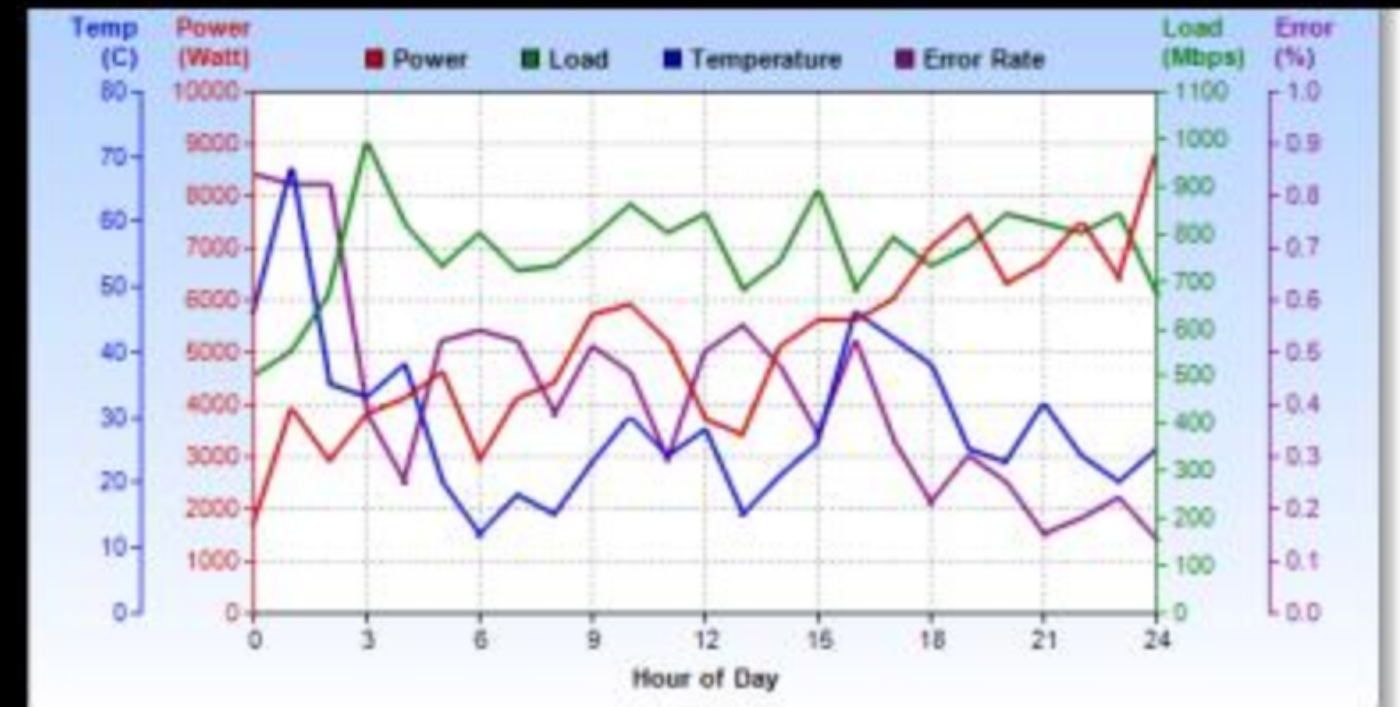

Multiple line chart and Multiple Axis Chart

- If we have to represent multiple data (similar data in same unit) varying with time, we can use **Multiple line chart**.

reliable data in same unit present in time-series

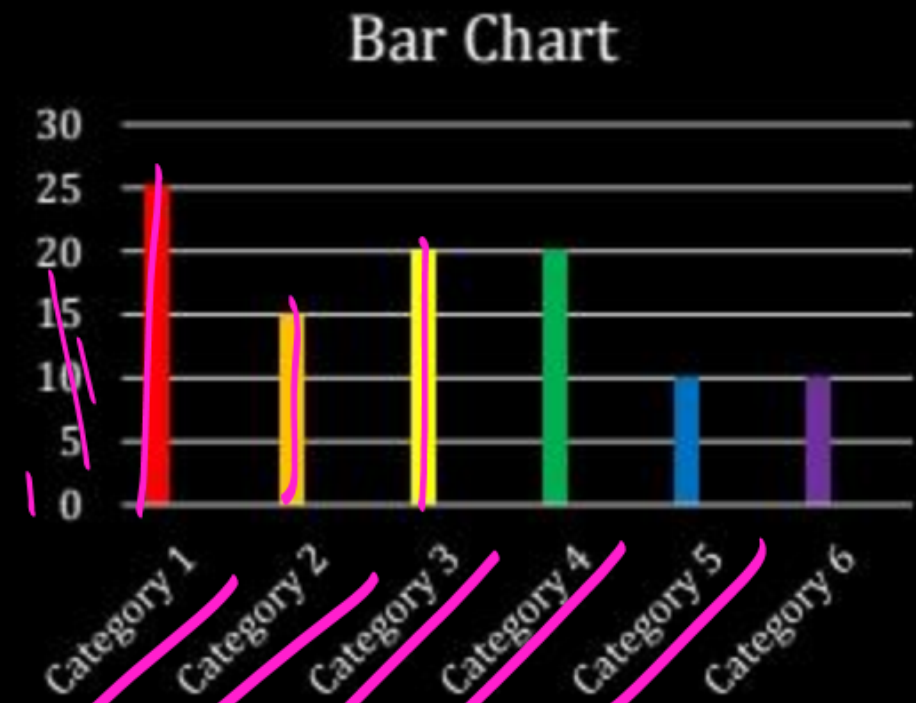

- If we have to represent multiple data (with different unit) varying with time, we can use **Multiple axis chart**.

Bar Diagram

Vertical Bar Diagram – Used for Quantitative and Time series Data *or Temporal Data*

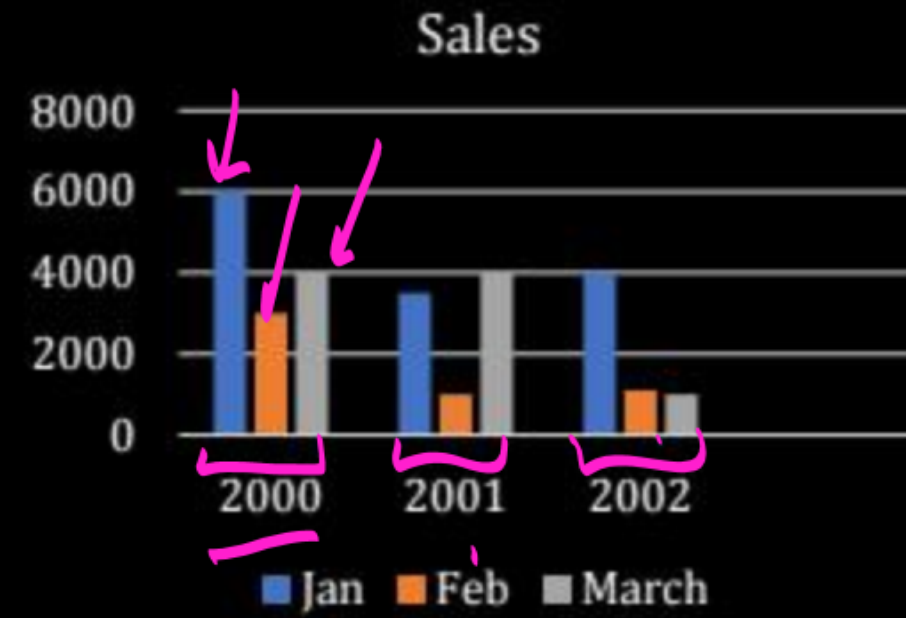

Horizontal Bar Diagram – Used for Qualitative or Geographical Data *or Spatial Data*

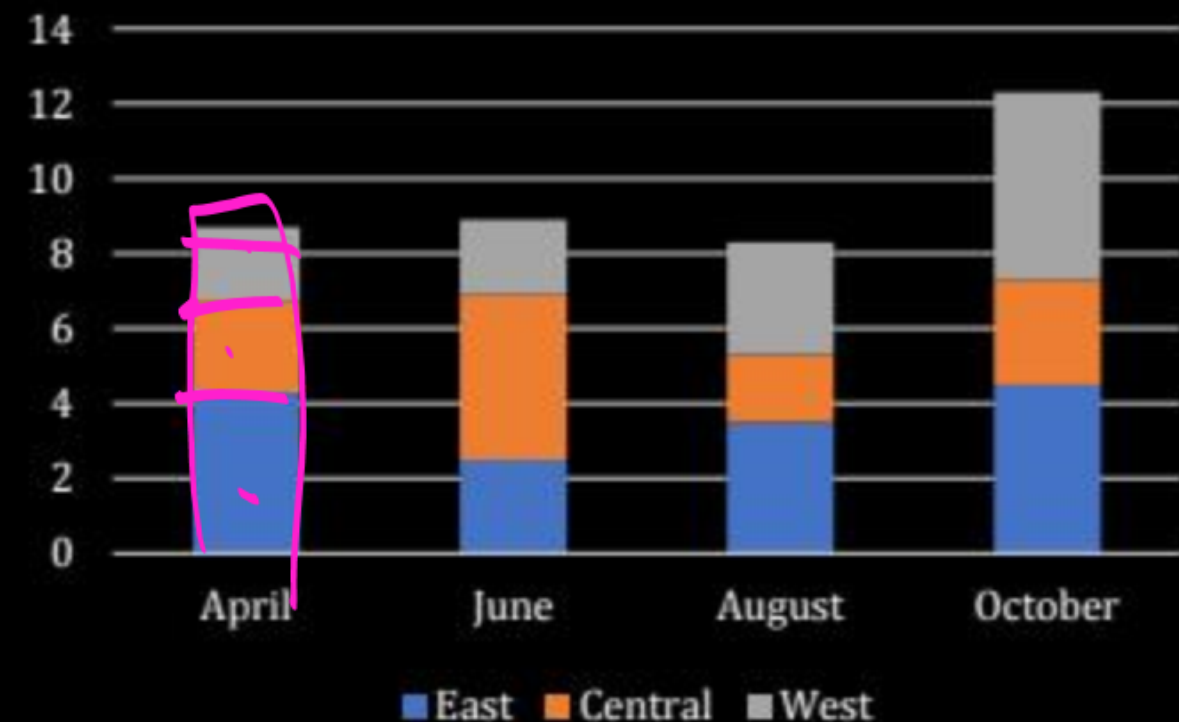

Bar Diagram

Multiple or Grouped Bar diagrams –
For Comparable series

Component or sub-divided Bar diagrams –
Data Divided into Multiple Component

Bar Diagram

Divided Bar Diagram / *Bar diagram*
For relative Comparison with whole

as well as comparison between different groups.

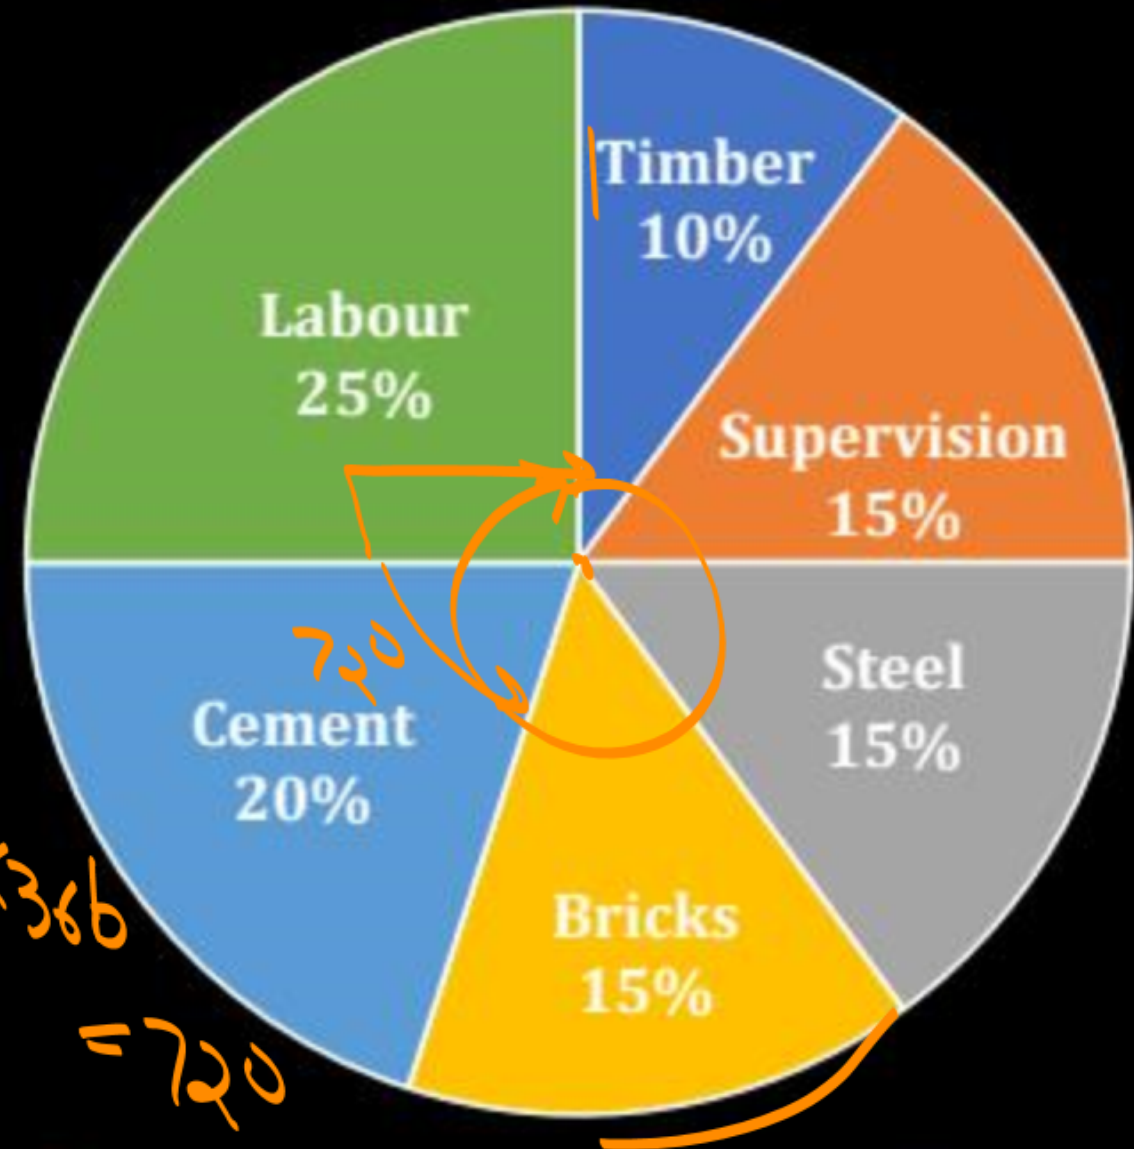

Pie Diagram

$$\text{Total} = 25 + 10 + 15 + 15 + 15 + 20 = 100$$

Cost of Construction of House

Formula for Angle Calculation :-

$$\text{Angle} = \frac{\text{Segment Value} \times 360}{\text{Total Value}}$$

Used for presenting a part with a whole

$$\text{Angle} = \frac{25}{100} \times 360 = 90$$

$$\frac{20}{100} \times 360 = 720$$

- Timber
- Supervision
- Steel
- Bricks
- Cement
- Labour

QUESTION - 01

The production of Wheat by different States of India are as shown below: -

State	Production
Haryana	20
Punjab	25
Uttarakhand	25
Up	20
Total	100%

2000

$\frac{20}{100} \times 360^\circ = 72^\circ$
 $\frac{25}{100} \times 360^\circ = 90^\circ$
 $\frac{25}{100} \times 360^\circ = 90^\circ$
 $\frac{20}{100} \times 360^\circ = 72^\circ$
 $\frac{100}{100} \times 360^\circ = 360^\circ$

Draw suitable diagram to represent the information

The mode of presentation of data are

- A** Textual, tabulation and diagrammatic ✓
- B** Tabular, internal and external
- C** Textual, tabular and internal
- D** Tabular, textual and external.

The best method of presentation of data is

- A** Textual ✓
- B** Tabular → Best | Expert
- C** Diagrammatic → Hidden Trend | Novice
- D** (b) and (c).

For tabulation, 'caption' is

- A** The upper part of the table
- B** The lower part of the table
- C** The main part of the table
- D** The upper part of a table that describes the column and sub-column.

'Stub' of a table is the

- A** Left part of the table describing the columns
- B** Right part of the table describing the columns
- C** Right part of the table describing the rows
- D** Left part of the table describing the rows.

The unit of measurement in tabulation is shown in

A Box head

B Body

C Caption

D Stub

QUESTION - 07

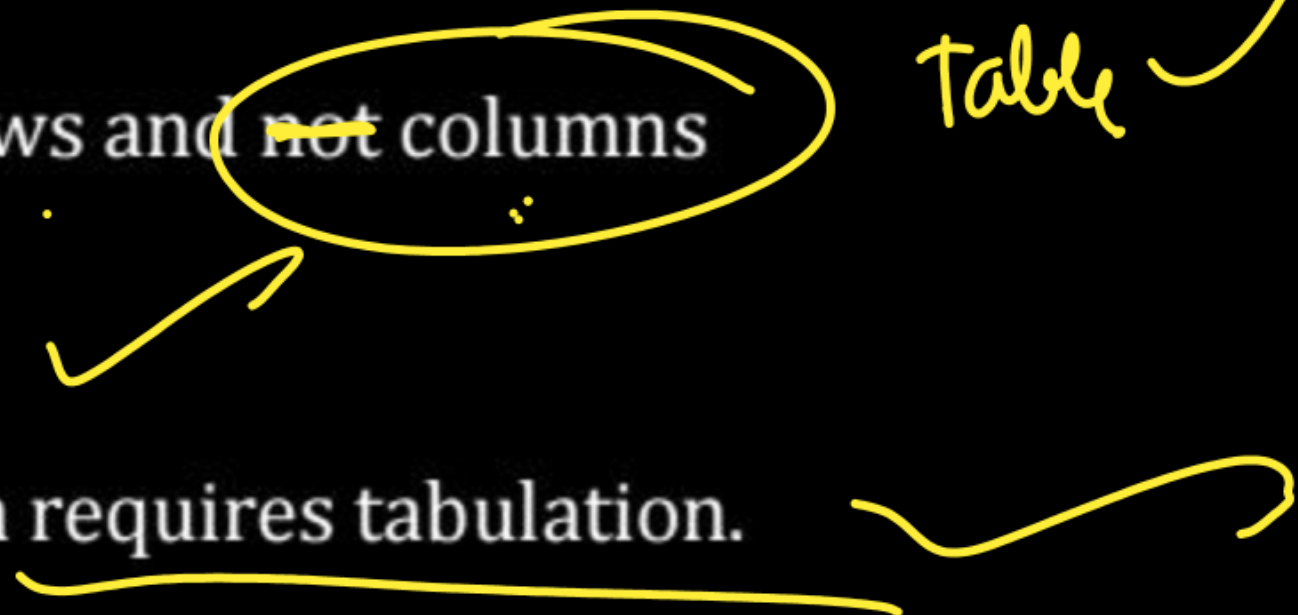

Which of the following statements is untrue for tabulation?

- A** Statistical analysis of data requires tabulation
- B** It facilitates comparison between rows and ~~not~~ columns
- C** Complicated data can be presented
- D** Diagrammatic representation of data requires tabulation.

Diagrammatic presents

Table

Hidden trend, if any, in the data can be noticed in

- A** Textual presentation
- B** Tabulation
- C** Diagrammatic representation
- D** All these

Multiple line chart is applied for

- A** Showing multiple charts
- B** Two or more related time series when the variables are expressed in the same unit → Multiple line chart
- C** Two or more related time series when the variables are expressed in different unit → Multiple axis chart
- D** Multiple variations in the time series.

QUESTION - 10

Horizontal bar diagram is used for

A Qualitative data ✓

B Data varying over time → Time Series

C Data varying over space ✓
→ Geographical

D (A) or (C)

QUESTION - 11

Divided bar chart is considered for

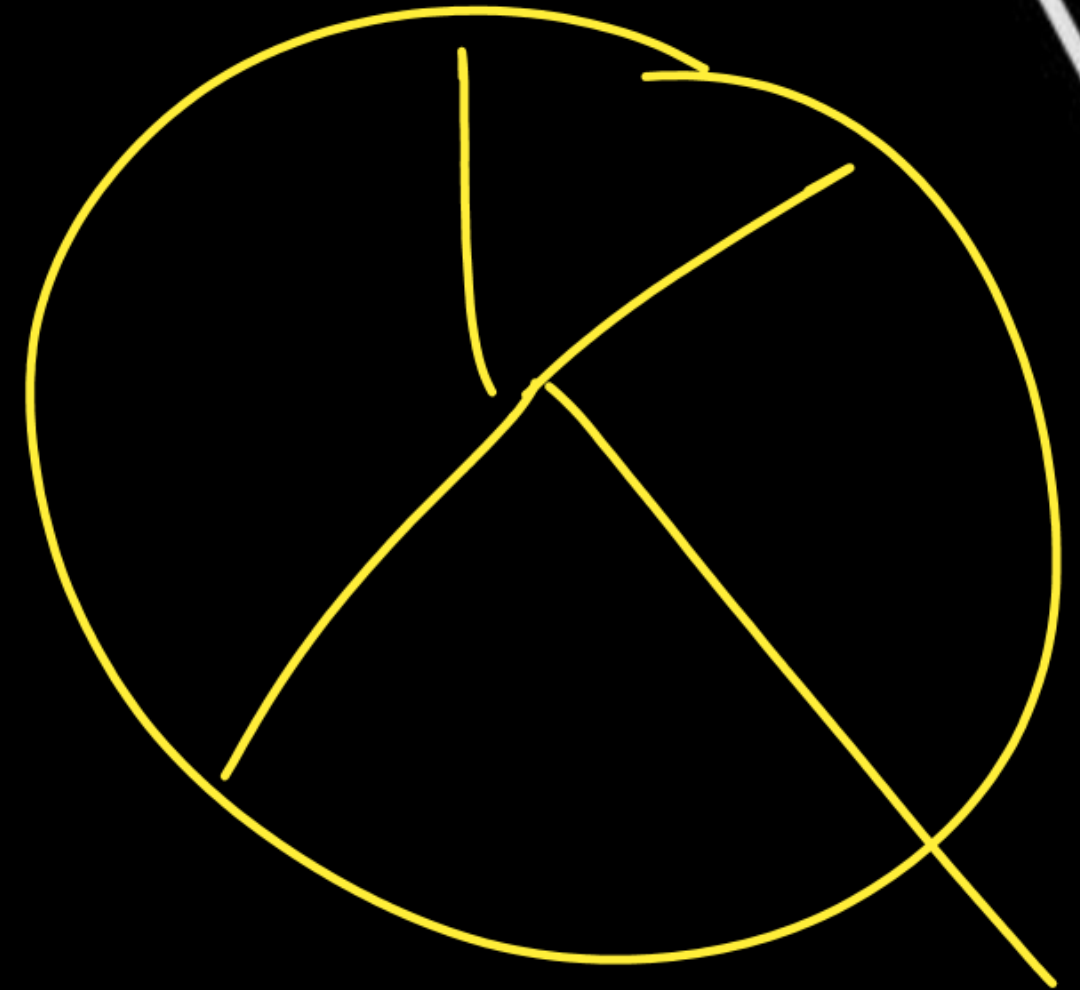

- A** Comparing different components of a variable
- B** The relation of different components to the table
- C** (A) or (B)
- D** (A) and (B)

QUESTION - 12

Pie-diagram is used for

- A** Comparing different components and their relation to the total
- B** Representing qualitative data in a circle
- C** Representing quantitative data in circle
- D** (b) or (c)

Frequency Distribution

Counting

- 1, 2, 3, 4, 6, 9, 9, 8, 5, 1, 1, 9, 9, 0, 6, 9.

The frequency of number 9 is: 5

- Frequency Distribution can be defined as the tabular representation of data in which we distribute total frequency to the number of classes.

Ungrouped
freq dist
→ Discrete Series

Grouped freq Dist
→ Discrete series
→ Continuous series

Ungrouped Frequency Distribution

- When we draw a tabulation for the frequency of data where data is in the form of discrete variable.

Example:

Let's say you survey a number of households and find out how many pets they own. The results are 3, 0, 1, 4, 4, 1, 2, 0, 2, 2, 0, 2, 0, 1, 3, 1, 2, 1, 1, 3. Let's distribute data in frequency table.

No. of Pets	Tally Marking	No. of Households
0		4
1		6
2		5
3		3
4		2

Frq

Grouped Frequency Distribution

- When we draw a tabulation for the frequency of data where data is in the form of discrete variable.

Example:

21 yr
21 yr 4m
21 yr 4m 3d
21 yr 4m 3d 20hr

21-22

Grouped

Count / Freq.

Age Group	Tally Marks	No. of People
0 - 10		5
10 - 20		4
20 - 30		3
30 - 40		4
40 - 50		6
50 - 60		2
60 - 70		6
		30

1-5 → Limits of class
 L.C.L U.C.L

Discrete

Road accident

No. of accident	No. of Roads
1-5	4
6-10	3
11-15	3
16-20	5
21-25	10
	25

Grouped freq
 0-10 → Boundaries
 L.C.B U.C.B
 Continuous
 Age
 0-10 } Class
 10-20 } Interval

Age Group	No. of people
0-10	5
10-20	4
20-30	5
30-40	3
40-50	5
50-60	6
60-70	2
	30

Boundary
 U.C.B of prev. class
 = L.C.B of next class

Some Important Terminologies

- Class Limit:** Corresponding to a class interval, the class limits may be defined as the minimum value and the maximum value of the class interval may contain. The minimum value is known as L.C.L and the maximum value is known as the U.C.L

Example :

Class - Interval	Frequency
150-153	7
154-157	7
158-161	15
162-165	10
166-169	5
170-173	6

Some Important Terminologies

- **Class boundary:** Class boundaries may be defined as the actual class limit of a class interval.

Continuous variable

For overlapping classification or **mutually exclusive classification**

Example:

exclude U.C.B while taking the value.

For non-overlapping or mutually inclusive classification

Example:

discrete → $L.C.B = L.C.L - \frac{gap}{2}$ $U.C.B = U.C.L + \frac{gap}{2}$

- **Please note that for overlapping class interval:** Class boundaries and Class limits are same.

QUESTION - 13

Find Upper Class Boundary And Lower Class Boundary

Class Limits

Class - Interval	Frequency
150-153	7
154-157	7
158-161	15
162-165	10
166-169	5
170-173	6

L.C.B are less than
Lower class limit
of interval

U.C.B are upper than
U.C.L of an interval

C.L = 173.5 - 169.5 = 4

~~C.L = 173 - 170 = 3~~

Some Important Terminologies

→ To represent a single value of an interval

Class Mid-Point: The class midpoint (or class mark) is a specific point in the center of the class interval in a frequency distribution table.

Mid-Point =

$$\frac{U.C.L + L.C.L}{2}$$

Example:

$$\text{or } \frac{U.C.B + L.C.B}{2}$$

Mid Pt

$$\frac{150 + 153}{2} = 151.5$$
$$155.2$$
$$159.5$$
$$163.5$$
$$167.5$$
$$171.5$$

Class - Interval	Frequency
150-153	7
154-157	7
158-161	15
162-165	10
166-169	5
170-173	6

QUESTION - 14

For the non - overlapping classes 0 -19, 20-39, 40-59 the class mark of the class 0 -19 is

- A** 0
- B** 19
- C** 9.5
- D** None

$$0 - 19$$

└───┘
┆

Mid. pt $\rightarrow \frac{0+19}{2} = 9.5$

Some Important Terminologies

- Width or Size of Class Interval: The class width is the difference between the upper-class boundary to the lower-class boundary of consecutive classes

Example:

Size of C.I
or Class length = U.C.B - L.C.B
= 40 - 30 = 10

Class - Interval	Frequency
0 - 10	4
10 - 20	8
20 - 30	13
30 - 40	12
40 - 50	6

Cumulative Frequency

- Cumulative frequency is defined as a running total of frequencies.

Cumulative frequency

More Than

(L.C.B)

Less Than (U.C.B)

(By default)

Example:

Class	Frequency	(L.C.B) More than	(U.C.B) Less than
0-10	4	43	4
10-20	8	39	12
20-30	13	31	25
30-40	12	18	37
40-50	6	6	43

For a C.B,

$C.T.C.F + M.T.C.F$

Total = 43

Class boundary	More than	Less than
→ 0	43	0
→ 10	39	4
→ 20	31	12
→ 30	18	25
→ 40	6	37
→ 50	0	43

31 + 12
43

Cumulative Frequency

➤ Frequency Density of Class Interval-

$$= \frac{\text{Class frequency}}{\text{C.L.}}$$

$$\text{C.L.} = \text{U.C.B} - \text{L.C.B} = 10 - 0 = 10$$

➤ Relative Frequency or %
Frequency of Class Interval

$$= \frac{\text{Class frequency}}{\text{Total Frequency}} \times 100\%$$

Class	Frequency	Frequency density	Relative frequency (%)
0-10	4	$\frac{4}{10} = 0.4$	$\frac{4}{43} \times 100\% = 9.3\%$
10-20	8	$\frac{8}{10} = 0.8$	$\frac{8}{43} \times 100\% = 18.6$
20-30	13	$\frac{13}{10} = 1.3$	$\frac{13}{43} \times 100\% = 30.23$
30-40	12	$\frac{12}{10} = 1.2$	$\frac{12}{43} \times 100\% = 27.91$
40-50	6	$\frac{6}{10} = 0.6$	$\frac{6}{43} \times 100\% = 13.95\%$
<u>Total = 43</u>			Sum = 100%

Graphical Representation of Frequency Distribution

HISTOGRAM

- The areas of rectangle are proportional to the frequencies.
- We can find the mode from Histogram

Class interval are of equal length

Frequency

FREQUENCY POLYGON: -

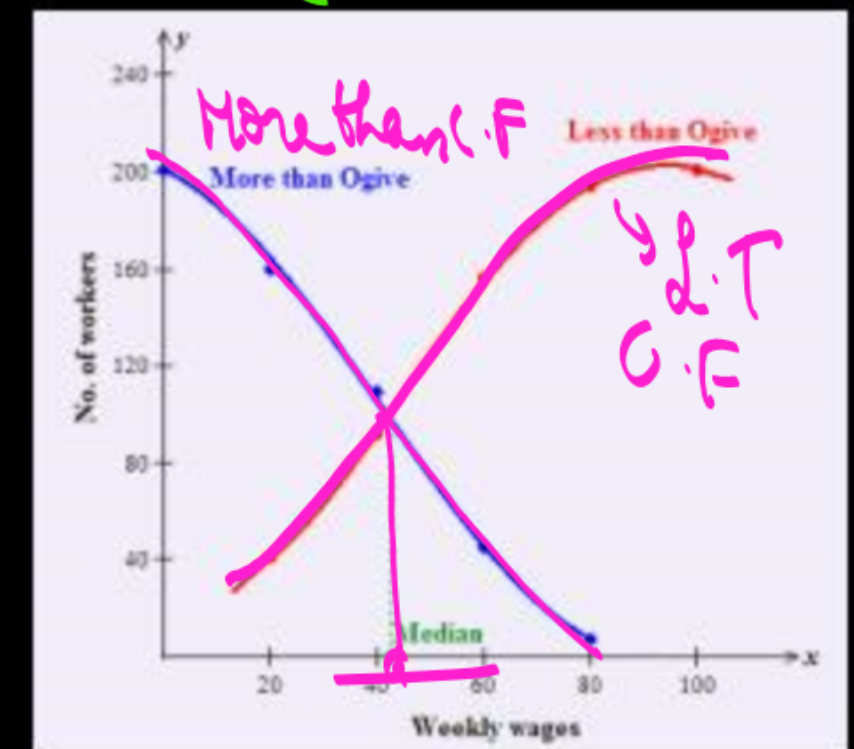

- We can draw frequency polygon by plotting the (x_i, f_i) and then joining it with the line.

mid point

freq.

OGIVES OR CUMULATIVE FREQUENCY GRAPH

- Ogives help us to find out Median.
- Ogives help us to find out Quartiles

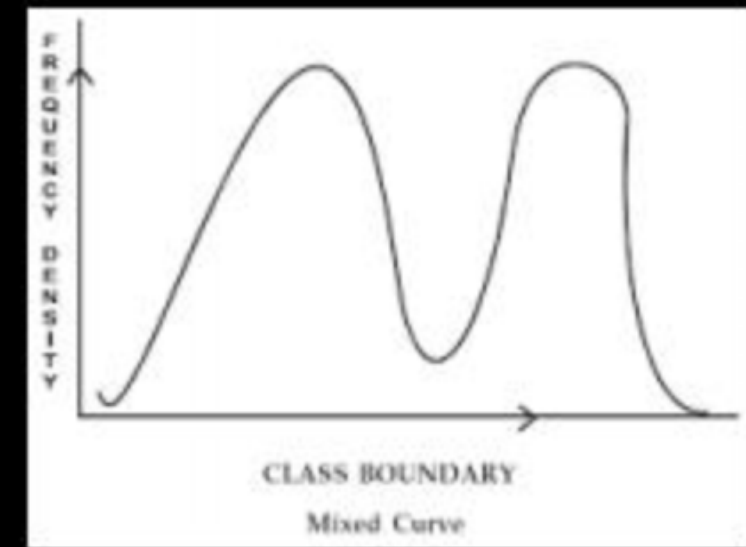

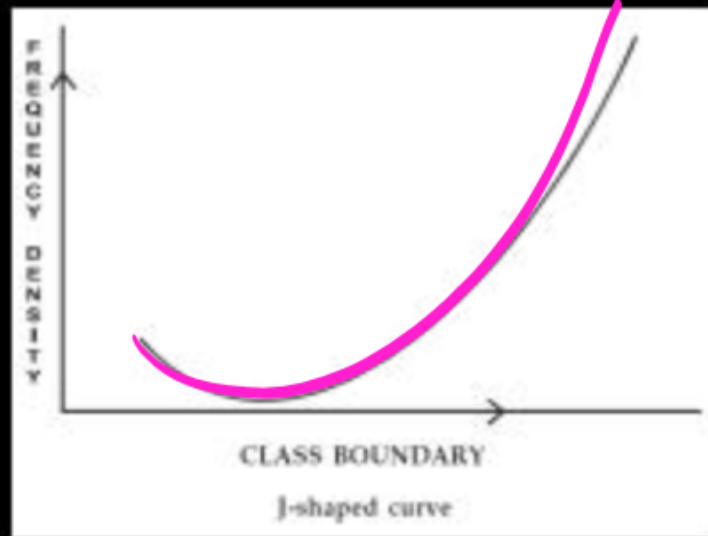

Frequency Curve

$$F \cdot D = \frac{F_{req}}{C.L}$$

- Limiting form of frequency polygon or histogram.
- Total area of frequency curve is taken to be unity.
- Graph is between frequency density on vertical axis with class boundary on horizontal axis

Area of freq = 1

QUESTION - 15

Class	0 - 10	10 - 20	20 - 30	30 - 40	40 - 50
Frequency	5	8	15	6	4

For the class 20-30, cumulative frequency is

- A** 20
- B** 13
- C** 15
- D** 28

Class	freq	(Less than) c.f.	More than c.f.
0-10	5	5	38
10-20	8	13	33
<u>20-30</u>	<u>15</u>	<u>28</u>	<u>25</u>
30-40	6	34	20
40-50	4	38	16
Total freq = 38			

5 + 33 = 38

QUESTION - 16

Mutually exclusive :- Cont. Series
↓
C.B and C.L are same

Mutually exclusive classification

- A** Excludes both the class limits
- B** Excludes the upper class limit but includes the lower class limit
- C** Includes the upper class limit but excludes the upper class limit
- D** Either (b) or (c)

QUESTION - 17

The LCB is

- A** An upper limit to LCL
- B** A lower limit to LCL
- C** (a) and (b)
- D** (a) or (b)

$$L.C.B = \frac{L.C.L - gap}{2}$$
$$U.C.B = \frac{U.C.L + gap}{2}$$

Length of a class is

- A** The difference between the UCB and LCB of that class
- B** The difference between the ~~UCL~~ and ~~LCL~~ of that class
- C** (a) or (b)
- D** Both (a) and (b)

QUESTION - 19

For a particular class boundary, the less than cumulative frequency and more than cumulative frequency add up to

$$L.T.C.F + M.T.C.F = T.F$$

- A** Total frequency
- B** Fifty per cent of the total frequency
- C** (a) or (b)
- D** None of these

Frequency density corresponding to a class interval is the ratio of

$$\Rightarrow \frac{\text{Freq.}}{\text{Class Length}}$$

- A Class frequency to the total frequency ~~X~~
- B Class frequency to the class length
- C Class length to the class frequency ~~X~~
- D Class frequency to the cumulative frequency ~~X~~

QUESTION - 21

Relative frequency for a particular class

- A** Lies between 0 and 1
- B** Lies between 0 and 1, both inclusive \equiv
- C** Lies between -1 and 0
- D** Lies between -1 to 1

$$R. F = \frac{\text{Freq of class}}{\text{Total freq}} = \frac{5}{10}$$

Frequency density corresponding to a class interval is the ratio of

- A** Class frequency to the total frequency
- B** Class frequency to the class length ✓
- C** Class length to the class frequency
- D** Class frequency to the cumulative frequency

$$FD = \frac{\text{Freq}}{\text{class length}}$$

QUESTION - 24

Mode of a distribution can be obtained from

- A** Histogram
- B** Less than type ogives
- C** More than type ogives
- D** Frequency polygon

QUESTION - 25

Median of a distribution can be obtained from

- A** Frequency polygon
- B** Histogram
- C** Less than type ogives
- D** None of these

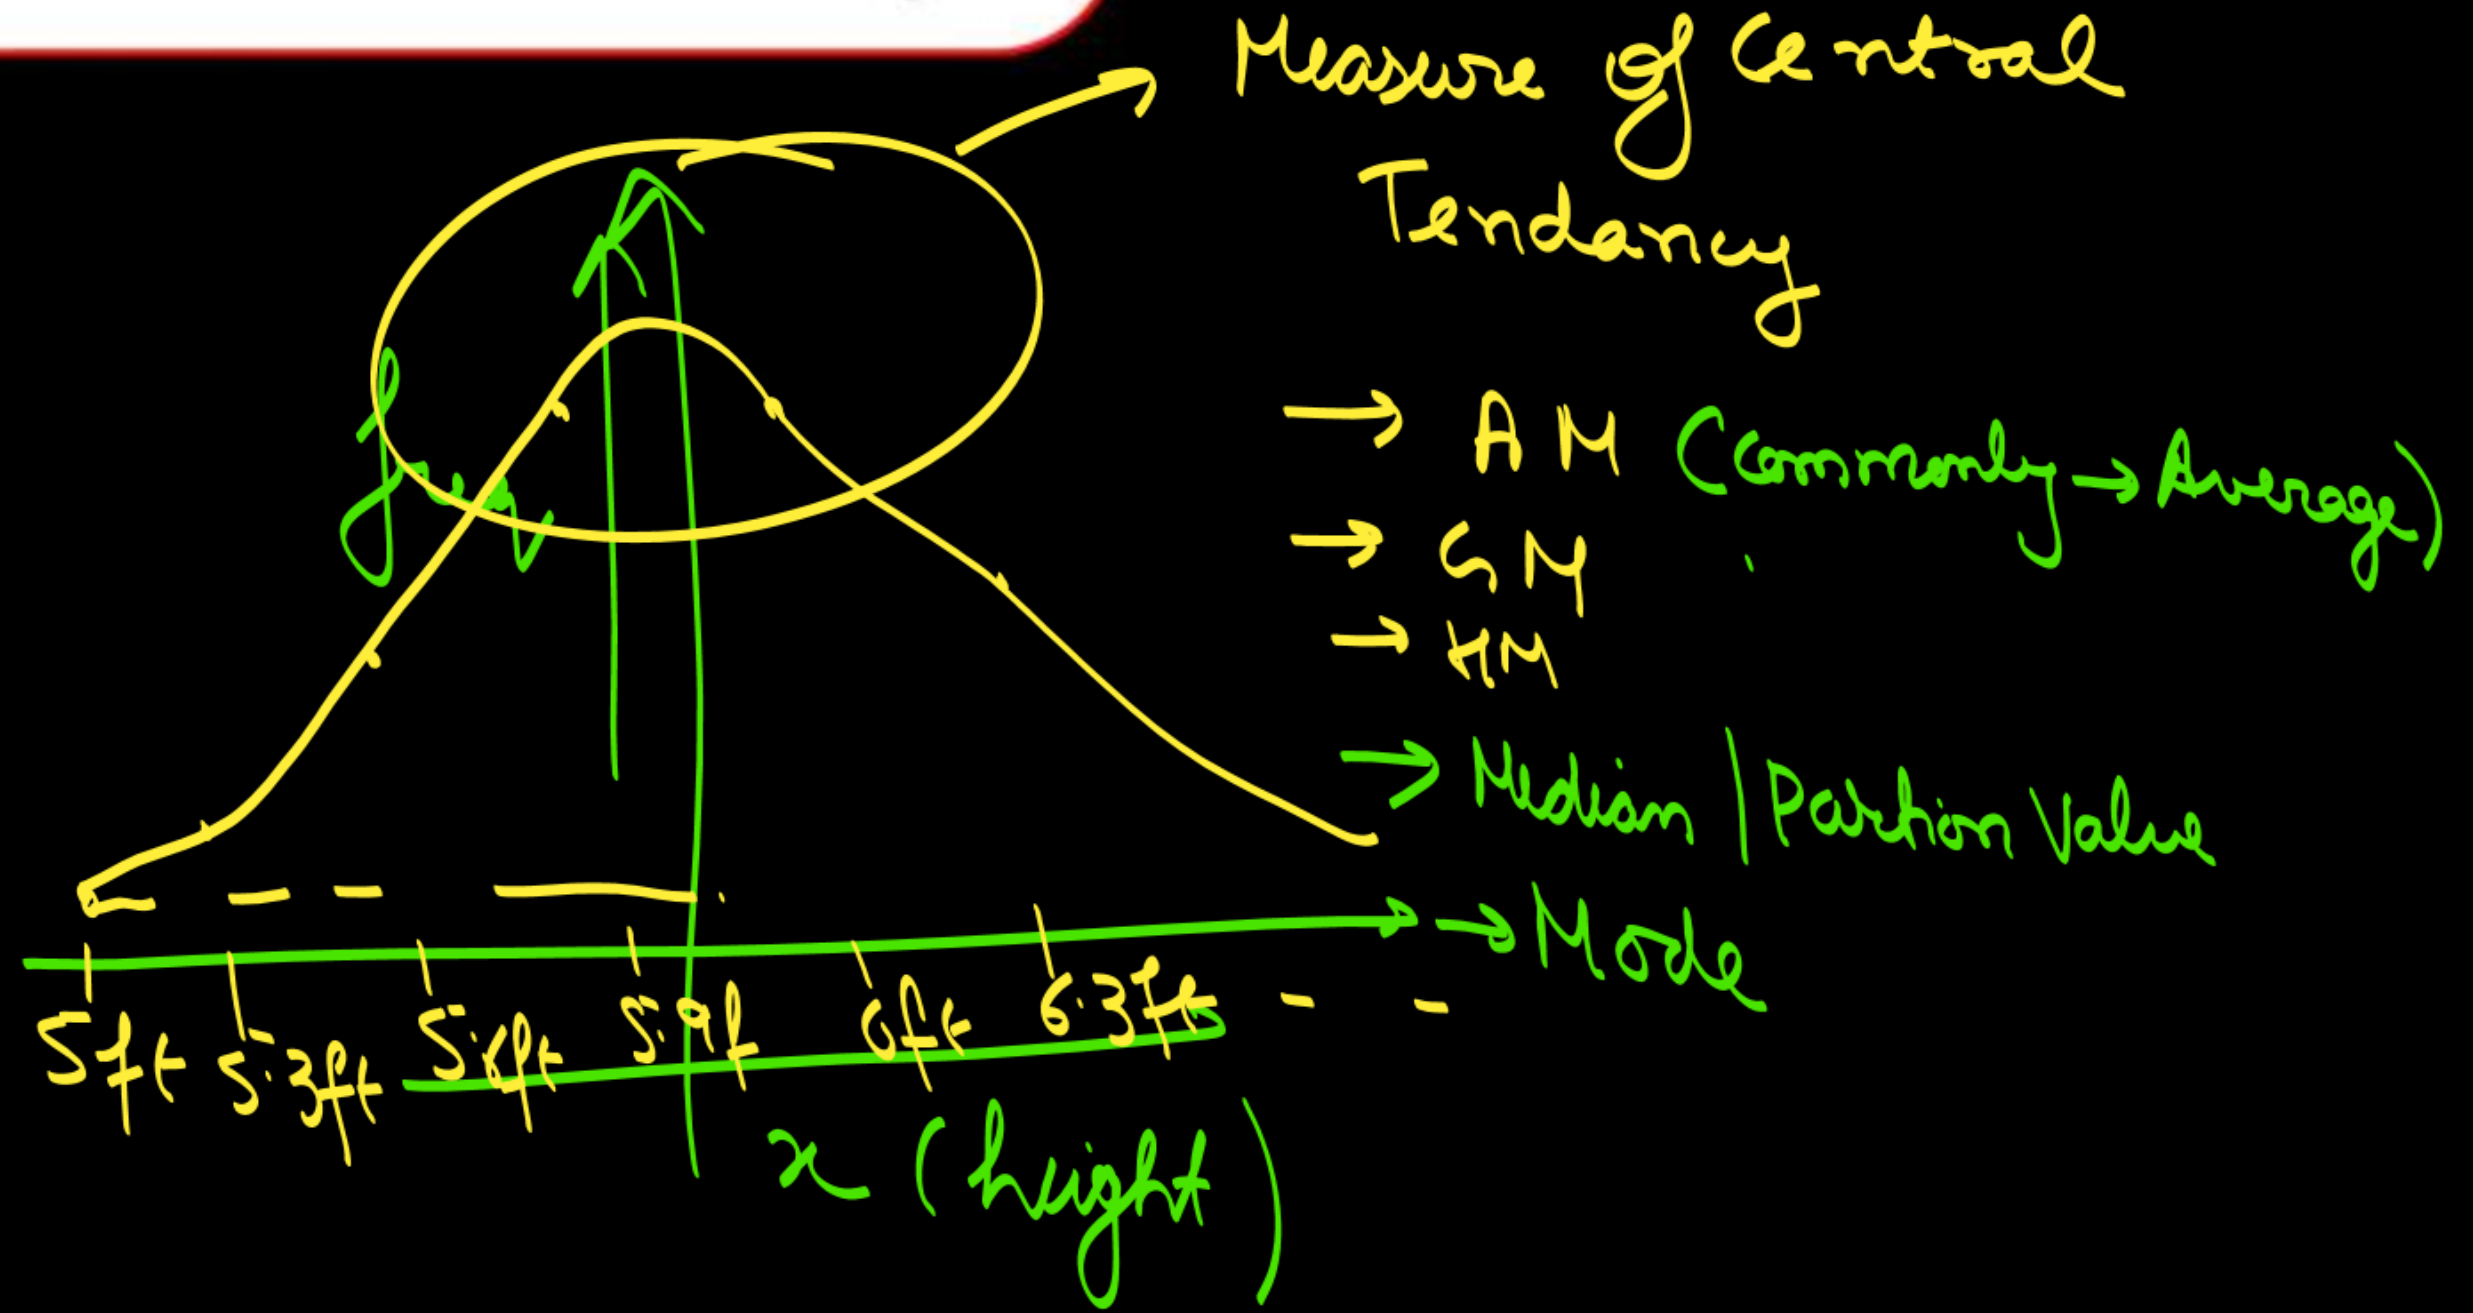

The distribution of profits of a company follows

- A** J-shaped frequency curve
- B** U-shaped frequency curve
- C** Bell-shaped frequency curve
- D** Any of these

What is Central Tendency

Arithmetic Mean

- Arithmetic mean is commonly known as average.
- The average of a given set of numbers is called the arithmetic mean, or simply, the mean of the given numbers.

i.e., Arithmetic Mean (Mean) =
$$\frac{x_1 + x_2 + x_3 + x_4 + \dots + x_n}{n}$$

- Let's variable x has n values- $x_1, x_2, x_3, x_4, x_5, \dots, x_n$

- Then, Arithmetic Mean is denoted by, which is equal to :

$$\bar{x} = \frac{\sum_{i=1}^n x_i}{n} \text{ or } \frac{\Sigma x_i}{n}$$

QUESTION 27

The following figures give the marks of 10 students in a class test: Marks obtained: 12 8 17 13 15 9 18 11 6 1. Find the arithmetic mean.

$$\bar{x} = \frac{12 + 8 + 17 + 13 + 15 + 9 + 18 + 11 + 6 + 1}{10}$$

$$\bar{x} = \frac{110}{10} = 11$$

Arithmetic Mean

$k, k, k, k, \dots \Rightarrow \bar{x} = k$

• If all the observations assumed by a variable are constants, say k , then the AM is k

• If all the observations are added, subtracted or multiplied by value k , then AM also gets added, subtracted or multiplied by value k

• The algebraic sum of deviations of a set of observations from their AM is zero

• AM is affected due to change in origin and/or scale i.e., $y = a + bx$, then the AM of y is given by $\bar{y} =$

$y = a + bx$
 $\bar{y} = a + b \cdot \bar{x}$
 change in origin (pointing to a)
 change in scale (pointing to b)

A.M. can not be represented graphically.

~~$\sum(x - \bar{x})^2 = \text{minimum}$~~

Sum of deviation from A.M. = 0

$$\sum (x_i - \bar{x}) = 0$$

x_i	$x_i - \bar{x}$
1	$1 - 3 = -2$
2	$2 - 3 = -1$
3	$3 - 3 = 0$
4	$4 - 3 = 1$
5	$5 - 3 = 2$

$$\bar{x} = \frac{15}{5} = 3$$

$$\begin{aligned} \sum (x_i - \bar{x}) &= -2 + (-1) + 0 + 1 + 2 \\ &= -2 - 1 + 0 + 1 + 2 = 0 \end{aligned}$$

$$\bar{x} = \frac{2 + 2 + 2 + 2 + 2}{5}$$

1	2	2	2	2	2	10
2	2	2	2	2	10	20
3	2	2	2	2	10	30
4	2	2	2	2	10	40
5	2	2	2	2	10	50
					50	100

$$= \frac{100}{50} = 2$$

QUESTION 28

The arithmetic mean of a set of 5 observations $\overset{+3}{5}, \overset{+3}{10}, \overset{+3}{15}, \overset{+3}{20}$ and $\overset{+3}{25}$ is 15. However, if each item is increased by 3, then arithmetic mean will be?

$$\bar{x} = 15$$

$$\bar{y} = \bar{x} + 3 = 15 + 3 = 18$$

QUESTION 29

The arithmetic mean of a set of 5 observations: 2, 4, 6, 8, 10 is 6. If each item is multiplied by 2, then new arithmetic mean will be?

$\times 2$ $\times 2$ $\times 2$ $\times 2$ $\times 2$ \downarrow

$$\bar{x} = 6$$

$$\bar{y} = 6 \times 2 = 12$$

If it is known that 2 variable x and y are related by equation $2x + 3y = 5$ and $\bar{x} = 1$ then y is?

$$2x + 3y = 5$$

$$\bar{x} = 1 \Rightarrow 2\bar{x} + 3\bar{y} = 5$$

$$\Rightarrow 2(1) + 3\bar{y} = 5$$

$$\Rightarrow 2 + 3\bar{y} = 5$$

$$\Rightarrow 3\bar{y} = 5 - 2 = 3$$

$$\Rightarrow \bar{y} = \frac{3}{3} = 1$$

Merits Arithmetic Mean

Merits. Arithmetic mean possesses the following merits:

1. It is rigidly defined. ✓
2. It is easy to calculate and simple to understand.
3. It is based on all the observations. ✓
4. It is suitable for further mathematical treatment.
5. Of all the averages, arithmetic mean is affected least by fluctuations of sampling.

Combined mean

$$\frac{n_1}{x_1} \quad \frac{n_2}{x_2} \Rightarrow \bar{x} = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$$

Correcting the incorrect mean.

5.1 ← 5 → 4.8

error

Demerits

2 3 4 5

5000

$$\bar{x} = 3.5$$

$$\bar{y} = \frac{2+3+4+5+5000}{5}$$

$$= 1002.8$$

1. It is very much affected by **extreme values.**
2. In a distribution with **open-end** classes the *am* → A.M nhi nikalta h
3. It can neither be determined by inspection nor can it be located graphically.
4. **It cannot be computed for a qualitative data such as honesty, beauty, intelligence etc.**
↳ Median
5. It may lead to wrong conclusions if the details of the data from which it is obtained are not available

QUESTION 31

Measures of central tendency for a given set of observations measures

- A** "The scatterness of the observations" → MOD
कल्ल सुअ।
- B** "The central location of the observations" → MOCT
- C** "Both (A) and (B)"
- D** None of these

**QUESTION 32**

While computing the AM from a grouped frequency distribution, we assume that

- A** The classes are of equal length
- B** The classes have equal frequency
- C** All the values of a class are equal to the mid-value of that class
- D** None of these

	x_i
0-10	5
10-20	15
20-30	25
30-40	35

Which of the following statements is wrong?

- A Mean is rigidly defined
- B Mean is ^{least} ~~not~~ affected due to sampling fluctuations
- C Mean has some mathematical properties
- D All these

QUESTION 34

If there are 3 observations 15, 20, 25 then the sum of deviation of the observations from their AM is

$$\sum (x_i - AM) = 0$$

- A 0
- B 5
- C -5
- D None of these

Median

→ ascending order
↓
Mid-Value

- Median, for a given set of observations, when arranged in an ascending order or a descending order of magnitude. It may be defined as the middle-most value
- As distinct from the arithmetic mean, which is based on all the items of the distribution, the median is what is called a positional average.

Calculation of Median - Individual Observations

For ungrouped data consisting of n observations, the calculation of median involves the following steps:

a. When n is odd, the value is given by

$$t_{\left(\frac{n+1}{2}\right)}$$

b. When n is even, the value is given by-

$$\frac{t_{\left(\frac{n}{2}\right)} + t_{\left(\frac{n}{2} + 1\right)}}{2}$$

QUESTION 35

Find the median for the following data:

(i) 19 22 17 20 12

(ii) 58 49 64 70 91 34

(1) 19, 22, 17, 20, 12
 ⇒ 12, 17, 19, 20, 22

Median =
 Median for odd no. of terms

Mid value = 19
 $= \left(\frac{n+1}{2} \right)^{\text{th}} \text{ term} = \left(\frac{5+1}{2} \right)^{\text{th}} = 3^{\text{rd}} = 19$

(2) 34, 49, 58, 64, 70, 91

Median =
 no. of terms is even (n)

$$\frac{\left(\frac{n}{2} \right)^{\text{th}} + \left(\frac{n}{2} + 1 \right)^{\text{th}}}{2}$$

$$= \frac{\left(\frac{6}{2} \right)^{\text{th}} + \left(\frac{6}{2} + 1 \right)^{\text{th}}}{2}$$

$$= \frac{3^{\text{rd}} + 4^{\text{th}}}{2}$$

$$= \frac{58 + 64}{2} = \frac{122}{2} = 61$$

In case of an even number of observations which of the following is median?

- A** Any of the two middle – most value
- B** The simple average of these two middle values
- C** The weighted average of these two middle values
- D** Any of these

$$\frac{2\left(\frac{n}{2}\right)^{\text{th}} + (2\left(\frac{n}{2} + 1\right)^{\text{th}})}{2}$$

Properties of Median

- (i) If x and y are two variables, to be related by $y = a + bx$ for any two constants a and b , then the median of y is given by

$$y = a + bx$$
$$\Rightarrow y_{\text{med}} = a + bx_{\text{med}}$$

- (ii) For a set of observations, the sum of absolute deviations is minimum when the deviations are taken from the median.

$$\sum |x - x_{\text{med}}| \Rightarrow \text{minimum}$$

19	$ 19-19 = 0 =0$
22	$ 22-19 = 3 =3$
20	$ 20-19 = 1 =1$
17	$ 17-19 = -2 =2$
12	$ 12-19 = -7 =7$

$$\sum |x_i - x_{med}|$$

$$\sum |x_i - x_{med}| = 13 \rightarrow \text{min}$$

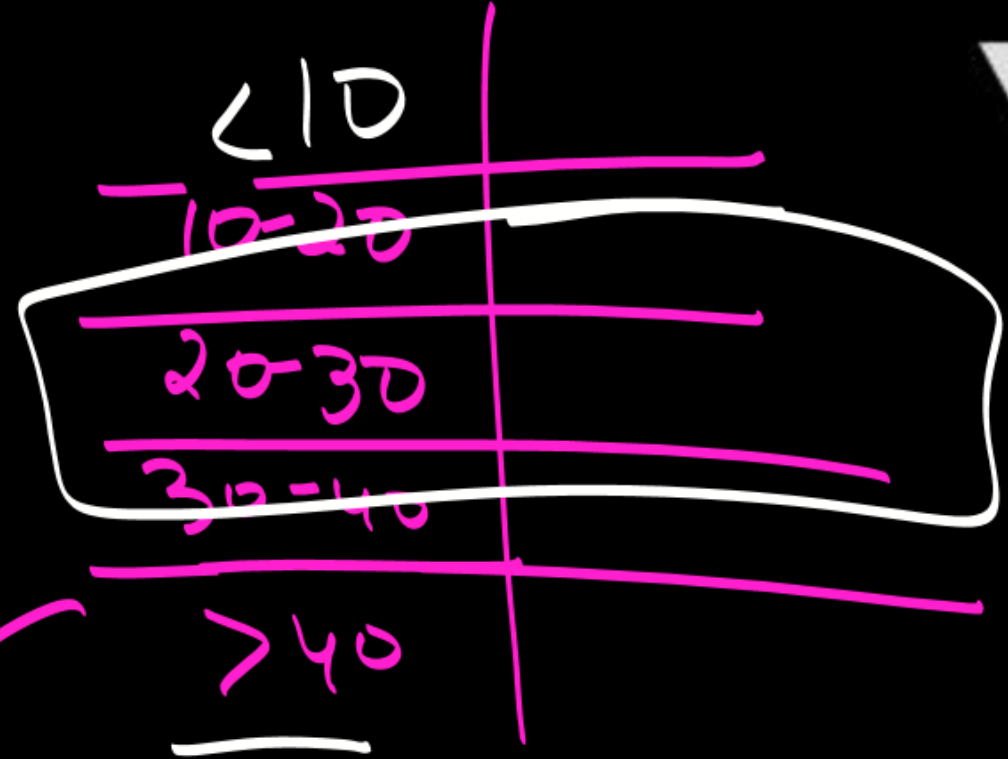

$$x_{med} = 19$$

Merits of Median

- 1. It is rigidly defined. ✓
- 2. It is easy to calculate and simple to understand. ✓
- 3. It can be **computed while dealing with a distribution with open end classes**
- 4. Being a positional average, it is not much **affected by extreme observations.**
- 5. It is the most appropriate average to be used **while dealing with qualitative data.**
- 6. It can sometimes be located by inspection and can also be determined graphically.

↓
Ogives

2 5 7 10 15000

Demerits of Median

1. Median, being a positional average, is not based on each and every item of the distribution.
 → Median only 50% of total data
 of Center
2. It is not suitable for further mathematical treatment. ✓
3. It cannot be determined exactly for an ungrouped data consisting of an even number of observations.
4. In comparison to arithmetic mean, it is much affected by sampling fluctuations.
5. For calculating median, it is necessary to arrange the data in order of magnitude.

QUESTION 37

Two variables x and y are given by $y = 2x - 3$. If the median of x is 20, what is the median of y ?

A 20

B 40

C 37

D 35

$$y = 2x - 3$$

$$x_{\text{med}} = 20$$

$$y_{\text{med}} = 2x_{\text{med}} - 3$$

$$= 2(20) - 3 = 40 - 3 = 37$$

Partition Value or Quartiles or Deciles or Percentiles

These may be defined as values dividing a given set of observations into a number of equal parts.

- **Quartiles** -
4 equal parts } 3Q.
- **Deciles** -
10 equal parts } 9D
- **Percentiles** -
100 equal parts } 99P

Calculation of Quartiles — Individual Observations

- For ungrouped data consisting of n observations (not necessarily all distinct), the calculation of k^{th} quartile $Q_k = (k = 1, 2, 3,)$ involves the following steps:

$$Q_1 = \left(\frac{(2+1)}{5} \right)^{\text{th}} \text{ term}$$

$$Q_2 = \left(\frac{(3+1)}{5} \right)^{\text{th}} \text{ term}$$

$$Q_3 = \left(\frac{(3+1)}{5} \right)^{\text{th}} \text{ term}$$

$$Q_4 = \left(\frac{(3+1)}{5} \right)^{\text{th}} \text{ term}$$

QUESTION 38

Calculate the quartiles Q_1, Q_2, Q_3 for the following data: -

23, 11, 9, 8, 6

Ascending order: - 6, 8, 9, 11, 23
 $n=5$

$$Q_1 = \left(\frac{1 \times (5+1)}{4} \right)^{\text{th}} = 1.5^{\text{th}} = 1^{\text{st}} + 0.5(2^{\text{nd}} - 1^{\text{st}}) = 6 + 0.5(8-6) = 6 + 0.5(2) = 7$$

Median = $Q_2 = \left(\frac{2 \times (5+1)}{4} \right)^{\text{th}} = 3^{\text{rd}} = 9$

$$Q_3 = \left(\frac{3 \times (5+1)}{4} \right)^{\text{th}} = 4.5^{\text{th}} = 4^{\text{th}} + 0.5(5^{\text{th}} - 4^{\text{th}}) = 11 + 0.5(23-11) = 11 + 6 = 17$$

QUESTION 39

Quartiles are the values dividing a given set of observations into

- A** Two equal parts
- B** Four equal parts
- C** Five equal parts
- D** None of these

Q_1, Q_2, Q_3

Decile

$$D_k = \left(\frac{k(n+1)}{10} \right)^{th}$$

Percentile

$$P_k = \left(\frac{k(n+1)}{100} \right)^{th}$$

QUESTION 40

Quartiles can be determined graphically using

- A** Histogram
- B** Frequency Polygon
- C** Ogive
- D** Pie chart

Mode

- The mode is the value that occurs the most often in a data set, or you can say the data with the maximum frequency is called as mode.

EXAMPLE :

1, 2, 3, 4, 4, 5, 2, 3, 4 What will be mode?

4 → no. of times ⇒ 3

Mode = 4

• Bi-Modal Distribution

Multi-Modal Distribution

No Mode

1, 1, 1, 2, 3, 4, 4, 4, 3, 3

1, 2, 3, 4, 5

- It is not uniquely defined.

- Calculated using Histogram ✓✓

Properties of Mode

➤ We also note that if $y = a + bx$, then $y_{\text{mo}} = a + bx_{\text{mo}}$

$$y = a + bx$$

$$y_{\text{mod}} = a + bx_{\text{mod}}$$

QUESTION 41

If $y = 2 + 1.50x$ and mode of x is 15, what is the mode of y ?

$$x_{\text{mod}} = 15$$

$$y_{\text{mod}} = 2 + 1.5x_{\text{mod}} = 2 + 1.5(15) = 2 + 22.5 = \underline{\underline{24.5}}$$

Merits and demerits of mode

Merits. Mode possesses the following merits

1. It is simple to understand and easy to calculate. ✓
2. In some cases it can be located merely by inspection. ✓
3. It can be determined graphically from a histogram. ✓
4. It is not at all affected by extreme observations and can be calculated even if extreme values are not known. ✓
5. It can be conveniently determined for distribution with open end classes. ✓

x_i	f_i
2	5
4	10
5	8
10	2
10000	1

Demerits of Mode

Mode has the following drawbacks

1. It is not rigidly defined → *no single value*
2. It is not based on all the observations.
3. It is not suitable for further mathematical treatment.
4. As compared to mean, mode is affected to a greater extent by the fluctuations of sampling.
5. The value of mode cannot always be determined. In some cases, we may have a bi-modal distribution.

QUESTION 42

Which of the following measure(s) satisfies (satisfy) a linear relationship between two variables?

$$y = a + bx$$

- A** Mean
- B** Median
- C** Mode
- D** All of these

QUESTION 43

Which of the following measures of central tendency is based on only fifty percent of the central values?

- A** Mean
- B** Median ✓
- C** Mode
- D** Both (A) and (B)

Geometric Mean

$$GM = (x_1 \times x_2 \times x_3 \dots \times x_n)^{\frac{1}{n}}$$

- GM is best measure of CT for ratio & percentages are constant. For example, with such data as **rates of change, per cent increase in sales, population sizes over consecutive time periods etc.**
- G.M. of two numbers 4 and 9 is $GM = (4 \times 9)^{\frac{1}{2}} = (36)^{\frac{1}{2}} = 6$
- And, G.M. of three numbers 1, 4 and 128 is $\Rightarrow GM = (1 \times 4 \times 128)^{\frac{1}{3}} = (512)^{\frac{1}{3}} = 8$
- It is the most appropriate average to be used in the construction of index numbers.
- It is the most suitable average to be used when it is desired to give more weightage to smaller items and vice-versa.

512
 $\sqrt[3]{512} \rightarrow 12 \text{ times}$
128
 $\sqrt[3]{128} \rightarrow 12 \text{ times}$
4
 $\sqrt[3]{4} \rightarrow 12 \text{ times}$
1
 $\sqrt[3]{1} \rightarrow 12 \text{ times}$

Properties

$$GM = (2 \times 2 \times 2 \times 2)^{\frac{1}{4}}$$

$$= (2^4)^{\frac{1}{4}} = 2$$

1. If all the observations assumed by a variable are constants, say $K > 0$, then the GM of the observations is also K .

$$\rightarrow K, K, K, \dots \rightarrow GM = K$$

2. GM of the product of two variables is the product of their GM's i.e. if $z = xy$, GM of $z =$

$$z = xy \rightarrow GM_z = GM_x \cdot GM_y$$

$$z = \frac{x}{y} \rightarrow GM_z = \frac{GM_x}{GM_y}$$

3. GM of the ratio of two variables is the ratio of the GM's of the two variables i.e. if $z = x/y$

GM of $z =$

QUESTION 44

Which of the following measure of the central tendency is difficult to compute?

A Mean

B Median

C Mode

D GM

Harmonic Mean

$$HM = \frac{\text{total obs}}{\text{Sum of reciprocal of obs.}}$$

- If all the observations taken by a variable are constants, say k, then the HM of the observations is also _____
- If there are two groups with n_1 and n_2 observations and H_1 and H_2 as respective HM's than the combined HM is given by

$$\begin{matrix} n_1 & n_2 \\ HM_1 & HM_2 \end{matrix}$$

$$HM = \frac{n_1 + n_2}{\frac{n_1}{H_1} + \frac{n_2}{H_2}}$$

- Harmonic means is used for reciprocal relationship average of speed, finding P/E ratio.

QUESTION 45

Find the harmonic mean of 5 numbers 4, 5, 6, 10 and 12.

$$n = 5$$

$$HM = \frac{5}{\frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \frac{1}{10} + \frac{1}{12}}$$

$$\frac{5}{x} = 5 \times \frac{1}{x} = 6.25$$

Sol: -

- $\frac{1}{4}$
- $\frac{1}{5}$
- $\frac{1}{6}$
- $\frac{1}{10}$
- $\frac{1}{12}$

or

$$x = 6.8$$

$$\frac{1}{x} \Rightarrow \boxed{0.8 \div} = x \Rightarrow \text{Ans}$$

Properties

k, k, k, k
 $\rightarrow AM = GM = HM = k$

If all values are distinct $\rightarrow AM > GM > HM$

1. If all the observations taken by a variable are constants, say k , then the HM of the observations is also k .

$$HM = \frac{4}{\frac{1}{2} + \frac{1}{2} + \frac{1}{2} + \frac{1}{2}} = \frac{4}{2} = 2$$

2. If there are two groups with n_1 and n_2 observations and H_1 and H_2 as respective HM's than the combined HM is given by

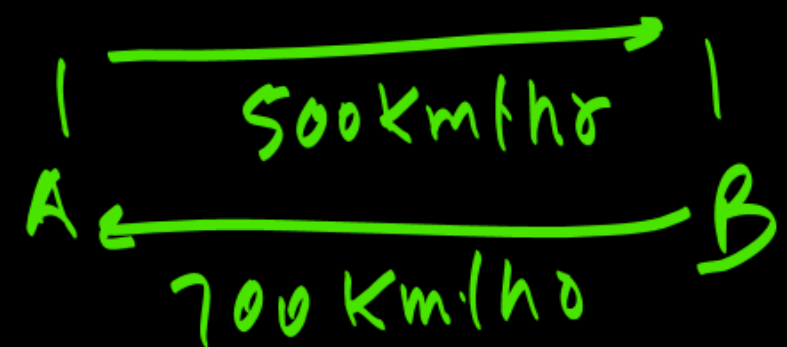

QUESTION 46

An aeroplane flies from A to B at the rate of 500 km/hour and comes back from B to A at the rate of 700 km/hour. The average speed of the aeroplane is

- A** 100 km per hour
- B** 583.33 km. per hour
- C** $100\sqrt{35}$ km. per hour
- D** 620 km. per hour.

HM = $\frac{2}{\frac{1}{500} + \frac{1}{700}} = \frac{2}{\frac{1}{x}} = 2 \times \frac{1}{x} = 583.33$ km/hr

Calc:- $\frac{1}{500} = \frac{1}{x}$
 $\frac{1}{700} = \frac{1}{x}$
 $\frac{1}{x} = \frac{1}{x}$
 $2 \times \frac{1}{x} = \frac{2}{x} \Rightarrow (x \div 2) \times 2 \Rightarrow \text{Ans}$

QUESTION 47

Which of the following measure(s) possesses (possess) mathematical properties?

- A AM
- B GM
- C HM
- D All of these 

Important Pointers

- Positional Average is Median and Mode

- Quantitative Average is AM HM and GM

- $AM \geq GM \geq HM$

→ $AM > GM > HM \Rightarrow$ when values are distinct
 $AM = GM = HM \Rightarrow$ If all are same

- $GM = \sqrt{AM \times HM}$

Moderately Skewed Dist

$Mean - Mode = 3 (Mean - Median)$

Empirical Relationship :

- $Mode = 3Median - 2Mean$

or $Mode - Mean = 3(Mean - Median)$

What is Central Tendency

	ARITHMETIC MEAN	GEOMETRIC MEAN	HARMONIC MEAN	MODE
Individual Observation	$\bar{x} = \frac{x_1 + x_2 + x_3 + \dots + x_n}{n}$ $\bar{x} = \frac{\sum_{i=1}^n x_i}{n}$	GM = $(x_1 \times x_2 \times x_3 \dots \times x_n)^{1/n}$ Logarithm of G for a set of observations is the AM of the logarithm of the observations; i.e. $\log GM = \frac{\sum \log x}{n}$ $G.M. = \text{Antilog} \frac{\sum \log x}{n}$	H.M. = $\frac{n}{\sum \left(\frac{1}{x_i}\right)}$	The value that occurs the maximum number of times

- Note:-**
- $y_{me} = a + bx_{me}$
 - $\sum(x_i - A)$ is minimum if we choose A as the median.

Measure of Dispersion

What is Dispersion?

Dispersion in statistics is a way of describing how spread out a set of data is.

Consider the following three sets of observations, each containing 9 items:

										Total	AM Mean
Set A	20	20	20	20	20	20	20	20	20	180	20
Set B	16	17	18	19	20	21	22	23	24	180	20
Set C	12	14	16	18	20	22	24	26	28	180	20

Therefore, we can say that, we need some more measures in addition to central tendency to describe the data completely.

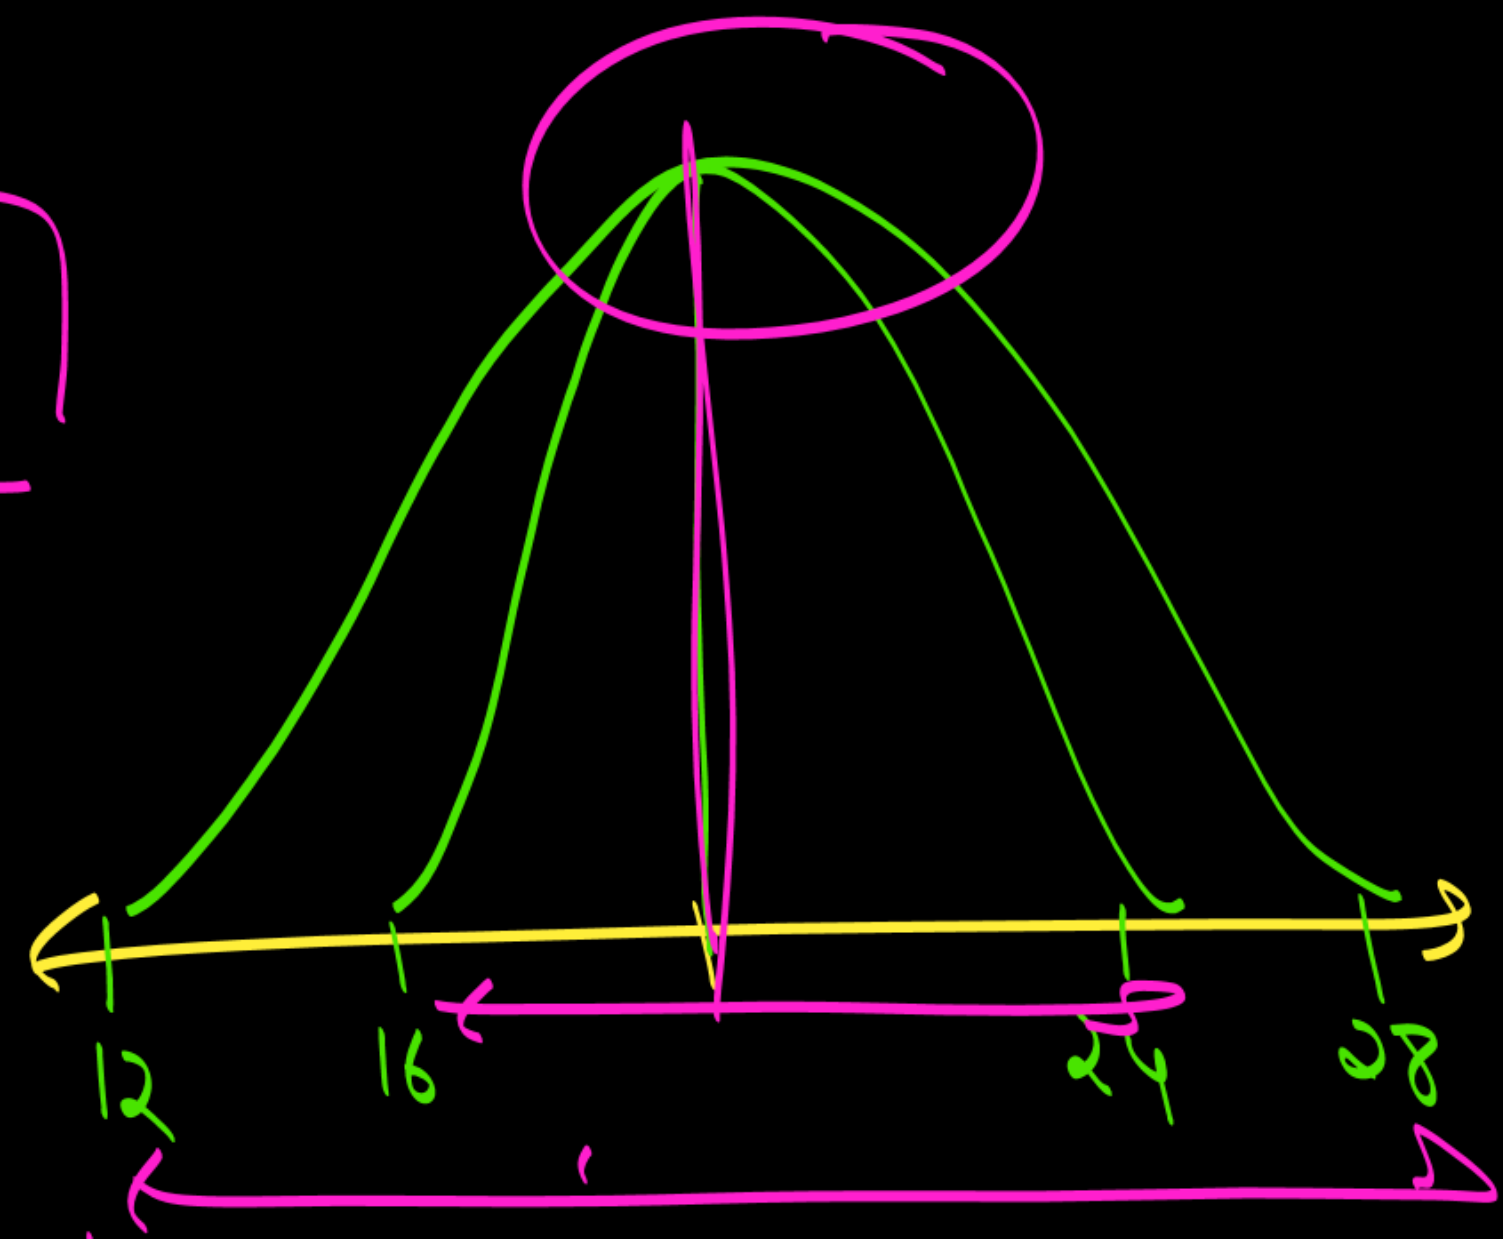

काला द

Dispersion

Measure of Dispersion

→ Range

MD | QD | SD

Measures of dispersion

For comparison of diff. reliable data

ABSOLUTE MEASURES OF DISPERSION

- Absolute measures are dependent on the unit of the variable under consideration
- Easy to comprehend and Compute

Different Measures ways: -

- Range
- Mean Deviation
- Standard Deviation
- Quartile Deviation

RELATIVE MEASURES OF DISPERSION

- Relative measures of dispersion are unit free.
- For comparing two or more distributions, relative measures of dispersion are considered.

Different Measures ways: -

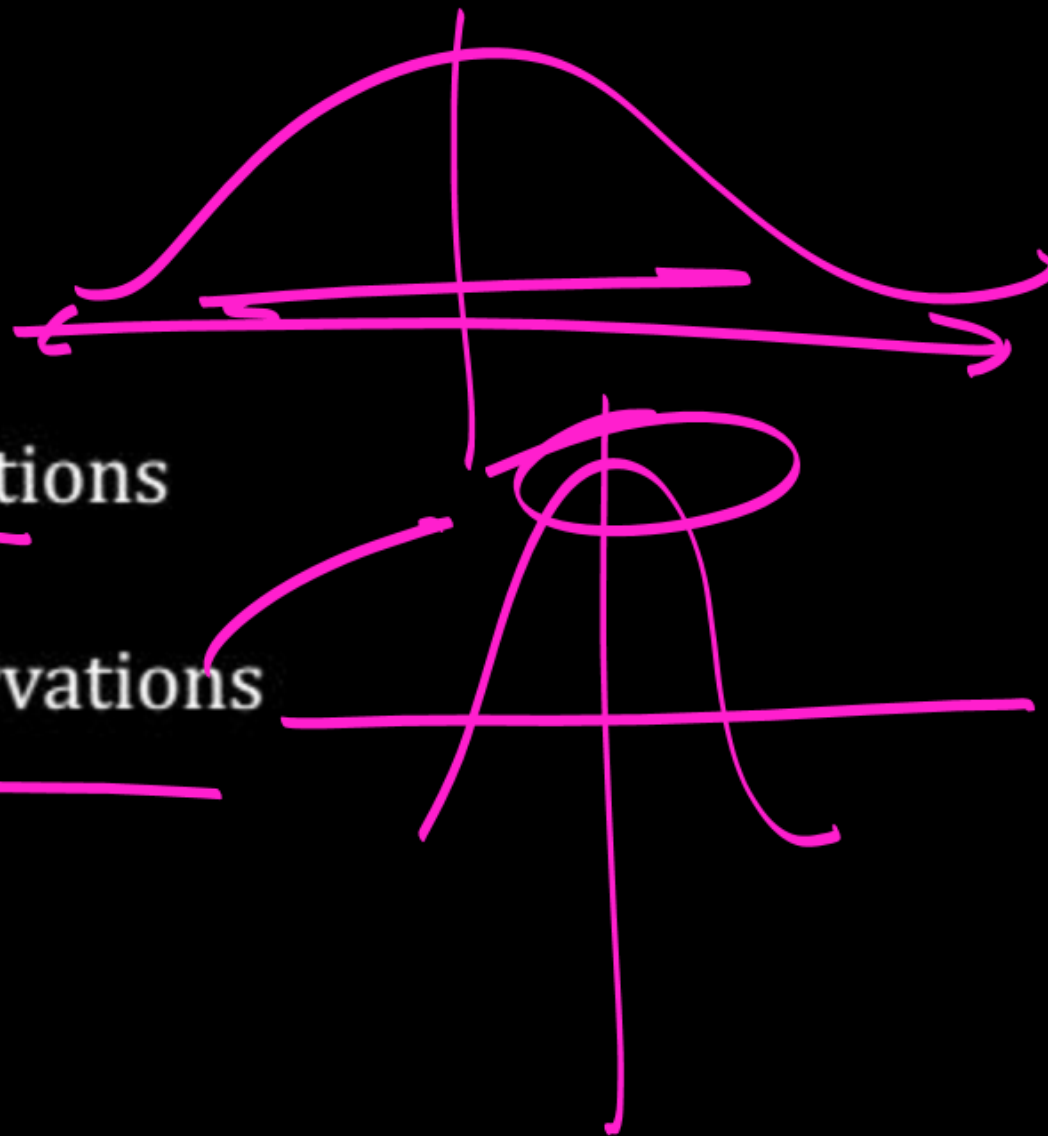

- Coefficient of Range.
- Coefficient of Mean Deviation
- Coefficient of Variation
- Coefficient of Quartile Deviation.

QUESTION 49

Dispersion measures

- A** The scatterness of a set of observations
- B** The concentration of a set of observations
- C** Both (A) and (B)
- D** Neither (A) and (B)

QUESTION 50

When it comes to comparing two or more distributions we consider

- A** Absolute measures of dispersion
- B** Relative measures of dispersion ✓✓
- C** Both (A) and (B)
- D** Either (A) or (B)

Measures of Dispersion

5, 10, 20, 15, 8
 Range = 20 - 5 = 15
 CoR = $\frac{20 - 5}{20 + 5} \times 100 = \frac{15}{25} \times 100 = 60\%$

	Absolute	Relative	If $y = a + bx$
RANGE (R)	Range = Largest (L) - Smallest (S)	Co efficient of Range = $\frac{L-S}{L+S} \times 100$	$R_y = b \times R_x$ ✓✓
MEAN DEVIATION (M.D) about A	$M.D_A = \frac{1}{n} \sum x - A $	Co efficient of M.D from A = $\frac{M.D \text{ about } A}{A} \times 100$	M.D $D_y = b \times M.D D_x$
MEAN DEVIATION (M.D) about A.M (\bar{x})	M.D about Mean = $\frac{1}{n} \sum x_i - \bar{X} $	Co efficient of M.D from A.M = $\frac{M.D \text{ about } \bar{x}}{\bar{x}} \times 100$	M. $D_y = b \times M \cdot D_x$
MEAN DEVIATION (M.D) about Median	M.D about Median = $\frac{1}{n} \sum x_i - \text{Median} $	Co efficient of M.D from Median = $\frac{M.D \text{ about } A}{A} \times 100$	M.D $D_y = b \times M \cdot D_x$

Properties of Range

$$y = a + bx$$

Range $y = |b| \times \text{Range of } x$

- Range remains unaffected due to a change of origin but affected in the same ratio due to a change in scale i.e., if for any two constants a and b , two variables x and y are related by

$$y = a + bx,$$

$$\text{Range of } y = |b| \times \text{Range of } x$$

Merits

The range possesses the following merits:

- It is simple to understand and easy to calculate.
- It requires minimum time to calculate the value of range.
- It is not based on all the observations. It considers only the extreme values

Demerits

1. It is not based on all the observations. ✓
2. Range is a poor measure of Dispersion. It considers only the extreme values
3. It is very much affected by fluctuations of sampling. Its value varies widely from sample to sample
4. It cannot be calculated for grouped frequency distribution with open-end classes.
5. It is not suitable for further mathematical treatment.

QUESTION 51

If the relationship between x and y is given by $2x + 5y = 10$ and the range of x is 5, what would be the range of y ?

$$2x + 5y = 10$$

Range of $x = 5$

Range of $y = ?$

~~$$2x + 5y = 10$$~~

Range of $x = 5$ Range of x

$2(\$) = \$ \times \text{Range of } x$

\Rightarrow Range of $y = 2$

$$\Rightarrow \frac{5y}{5} = \frac{10 - 2x}{5}$$

$$\Rightarrow y = \frac{10}{5} - \frac{2}{5}x$$

$$\text{Range of } y = \frac{10}{5} \times \text{Range of } x$$

$$= \frac{10}{5} \times 2 = 2$$

Mean Deviation

Average of absolute deviation
around mean or median

$$MD = \frac{\sum |x_i - \bar{x}|}{n} \text{ or } \frac{\sum |x_i - x_{med}|}{n}$$

- Mean deviation is computed about mean or median because mode is ill defined
- Mean deviation about median is beneficial because the sum of the deviations of items from median is least
 $\sum |x_i - x_{med}| \Rightarrow \text{minimum}$
- Mean is more frequently used in computing the average deviation
- Mean deviation remains unchanged due to a change of origin but changes in the same ratio due to a change in scale

If x and y are related as $3x + 4y + 7 = 0$ and mean deviation of x is 6.40, what is the mean deviation of y ?

$$3x + 4y + 7 = 0$$

$$MD_x = 6.4$$

$$MD_y =$$

Shortcut

~~$$3x + 4y + 7 = 0$$~~

$$3 MD_x = 4 MD_y$$

$$\Rightarrow 3(6.4) = 4 MD_y$$

$$\Rightarrow MD_y = \frac{3}{4}(6.4) = 4.8$$

$$y = \frac{-7 - 3x}{4}$$

~~$$y = \frac{-7 - 3x}{4}$$~~

$$MD_y = \frac{3}{4} \times MD_x$$

~~$$\frac{3}{4} \times 6.4 = 3 \times 1.6 = 4.8$$~~

~~$$y = -\frac{7}{4} - \frac{3}{4}x$$~~
~~$$MD_y = \frac{3}{4} \times MD_x$$~~

Merits of Mean Deviation

1. It is easy to understand and simple to calculate. ✓
2. It is based on each and every item of the data. ✓
3. It is rigidly defined. ✓
4. As compared , it is less affected by extreme observations. ✓

Demerits of Mean Deviation

1. The major drawback of mean deviation is that algebraic signs are ignored while taking the deviations of the items.
2. It is not suitable for further mathematical treatment.
3. It cannot be computed for distribution with open-end classes.

only MOD which can be compute for open end classes is Quartile Deviation.

$$\text{Coeff of MD} = \frac{\text{MD about mean}}{\text{mean}} \times 100$$

or

$$\frac{\text{MD about Median}}{\text{Median}} \times 100$$

Quartile Deviation

→ Semi-inter quartile Range

Q_1, Q_2, Q_3

- Inter-quartile range = $Q_3 - Q_1$
- Quartile deviation, also called semi-inter-quartile range,

- Quartile Deviation (Q.D.) =
$$\frac{Q_3 - Q_1}{2}$$

Coefficient of Quartile Deviation

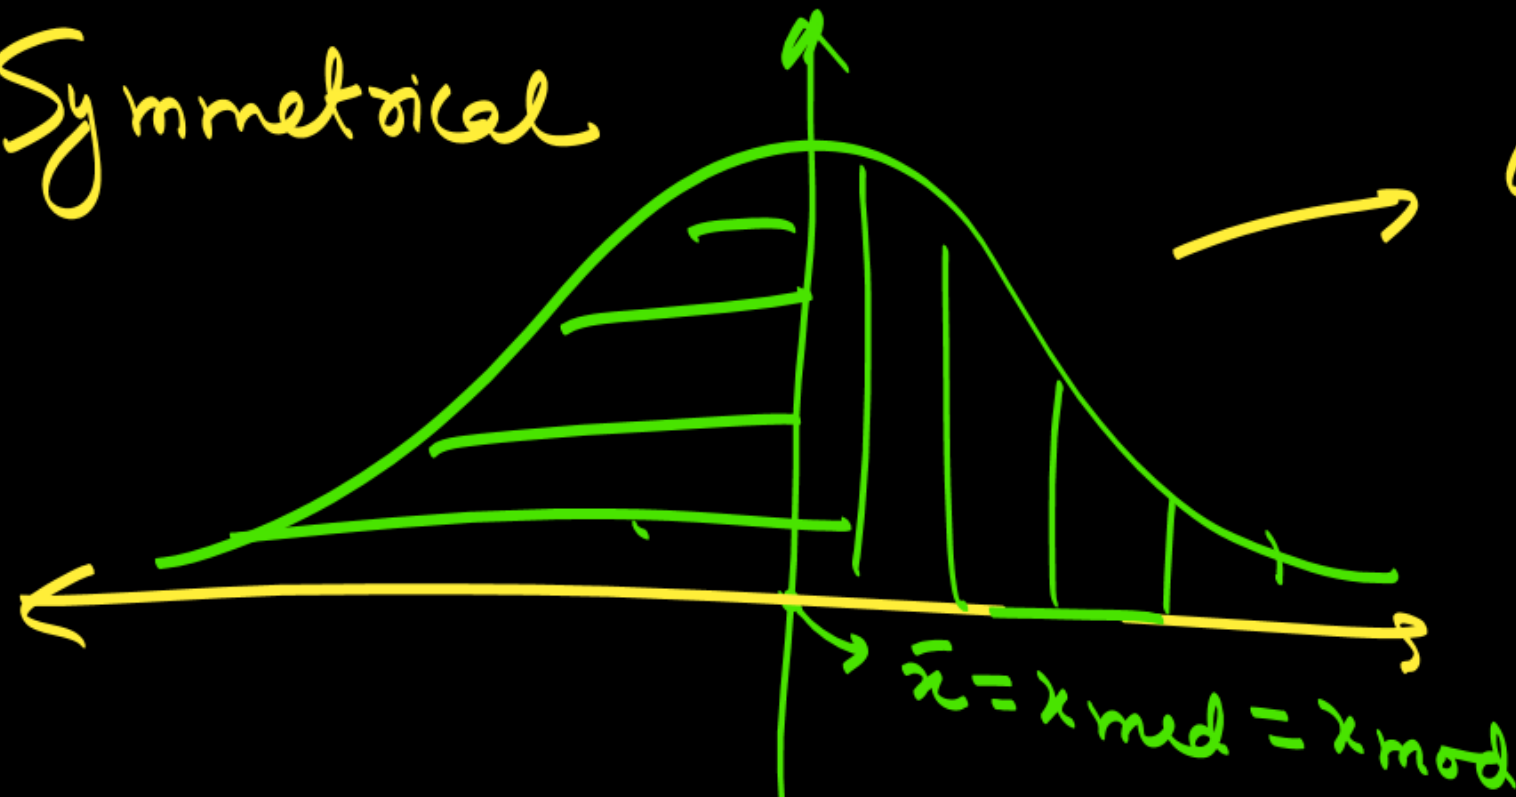

- The coefficient of quartile deviation is a relative measure of dispersion defined by

$$\text{Coefficient of Quartile Deviation} = \frac{Q_3 - Q_1}{Q_3 + Q_1} \times 100$$

- Coefficient of quartile deviation is a pure number and can be used to compare two distributions expressed in different

Symmetrical

Cof. of QD

$$= \frac{QD}{\text{Median}} \times 100$$

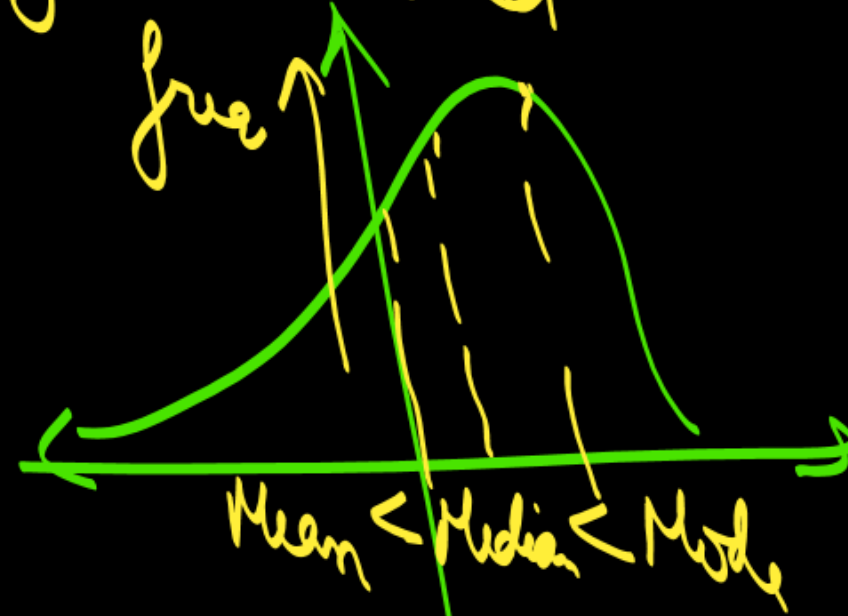

Skewed

Positively

Negative Skewed

Mean

Properties

- Like other measures of dispersion, quartile deviation remains unaffected due to a change of origin but is affected in the same ratio due to change in scale.

Merits

- Quartile deviation provides the best measure of dispersion for open-end classification.
- It is also less affected due to sampling fluctuations ✓
- Quartile deviation is useful specially when it is desired to study variability in the central half part of the data. ✓

Demerits

- Quartile deviation is not based on all the observations. ✓
- Quartile deviation is not suitable for further mathematical treatment. ✓
- It is affected considerably by sampling fluctuations. ✓

$$y = a + bx$$
$$\text{QD}_y = |b| \times \text{QD}_x$$

QUESTION 53

If x and y are related as $3x + 4y = 20$ and the quartile deviation of x is 12, then the quartile deviation of y is

- A** 16
- B** 14
- C** 10
- D** 9

Handwritten solution in green ink:

$QD_x = 12$
 $QD_y = ?$

~~$3x + 4y = 20$~~

$3 QD_x = 4 QD_y$

$3(12) = 4 QD_y$

$QD_y = \frac{3 \times 12}{4} = 9$

Measures of Dispersion

Chart

	Absolute	Relative	If $y = a + bx$
RANGE (R)	Range = Largest (L) - Smallest (S)	Co efficient of Range = $\frac{L-S}{L+S} \times 100$	$R_y = b \times R_x$
MEAN DEVIATION (M.D) about A	$M. D_A = \frac{1}{n} \sum x - A $	Co efficient of M.D from A $= \frac{M.D \text{ about } A}{A} \times 100$	$M.D D_y = b \times M.D D_x$
MEAN DEVIATION (M.D) about A.M (\bar{x})	M.D about Mean $= \frac{1}{n} \sum x_i - \bar{X} $	Co efficient of M.D from A.M $= \frac{M.D \text{ about } \bar{x}}{\bar{x}} \times 100$	$M. D_y = b \times M \cdot D_x$
MEAN DEVIATION (M.D) about Median	M.D about Median $= \frac{1}{n} \sum x_i - \text{Median} $	Co efficient of M.D from Median $= \frac{M.D \text{ about } A}{A} \times 100$	$M.D D_y = b \times M \cdot D_x$

Standard Deviation

→ Best MOD

It is the positive square root of the arithmetic mean of the squares of deviations of the observations from their arithmetic mean.

Root mean squared deviation from mean

$$\sigma = \sqrt{\frac{\sum (x_i - \bar{x})^2}{n}}$$

Coefficient of Variation

COV
high → Dispersion is high
low → Dispersion is low → More
Consistent
More uniform

- The coefficient of variation, is a relative measure of dispersion and is given by

$$\text{Coefficient of Variation} = \frac{\sigma}{\bar{x}} \times 100$$

- This is a pure number independent of the units of measurement and hence can be used to compare the variability of two distributions expressed in different units.
- A distribution for which the coefficient of variation is smaller is said to be less variable or more consistent, more uniform, more stable or more homogeneous.
- On the other hand, the distribution ~~for which the coefficient of variation is~~ greater is said to be more variable or less consistent, less uniform, less stable or less homogeneous.

QUESTION 54

The algebraic sum of 10 items about 8 is -5. Find its arithmetic mean. Also find coefficient of variation if standard deviation is 1.5.

Numerical Question → Next class of Chambyariti

Properties of Standard Deviation

- Standard deviation is suitable for further mathematical treatment.
- Standard deviation is independent of change of origin but not of scale, if $y = a + bx$ for any two constants a and b , then

SD of $y =$

$$y = a + b \cdot x$$
$$SD_y = |b| \times SD_x$$

- If all the observations assumed by a variable are constant i.e., equal, then the SD is zero. This result applies all measure of dispersion

- $*$ The standard deviation of first n natural numbers is $= \sqrt{\frac{n^2-1}{12}}$

$\rightarrow 1, 2, 3, 4, 5$

$$SD = \sqrt{\frac{5^2-1}{12}} = \sqrt{\frac{25-1}{12}} = \sqrt{\frac{24}{12}} = \sqrt{2}$$

If all value are same

2, 2, 2, 2

$$\text{Range} = 0$$

$$\text{IQR} = 0$$

$$\text{QD} = 0$$

$$\text{SD} = 0$$

QUESTION 55

Find SD of 1, 2, 3, 4, 5, 6, 7, 8, 9

A $\sqrt{\frac{20}{3}}$

B $\sqrt{\frac{81}{3}}$

C $\sqrt{\frac{20}{5}}$

D None of these

$$SD = \sqrt{\frac{9^2 - 1}{12}} = \sqrt{\frac{81 - 1}{12}} = \sqrt{\frac{80}{12}} = \sqrt{\frac{20}{3}}$$

Properties of Standard Deviation

- If frequencies of all observations are same, count them once only.

S.D. between 2 No.'s = $\frac{|a-b|}{2}$

Handwritten notes:

$\rightarrow SD = \frac{\text{Range}}{2}$

$SD = \frac{8-2}{2} = \frac{6}{2} = 3$

$SD = \frac{|2-8|}{2} = \frac{6}{2} = 3$

- Relationship between MD, QD & S.D. (Symm.)

4S.D. = 5MD = 6QD

Skewness

QUESTION 56

For any two numbers SD is always

- A Twice the range
- B Half of the range
- C Square of the range
- D None of these

$$SD = \frac{|a-b|}{2} \rightarrow \frac{\text{Range}}{2}$$

a, b

QUESTION 57

The standard deviation of 10, 16, 10, 16, 10, 10, 16, 16 is

- A** 4
- B** 6
- C** 3
- D** 0

x_i	f_i
10	4
16	4

$x_i \Rightarrow 10, 16$

$$SD = \frac{16-10}{2} = \frac{6}{2} = 3$$

Standard Deviation

$$\text{Variance} = (\text{SD})^2$$

	Absolute	Relative	If $y = a + bx$
Standard Deviation (σ)	$\sigma = \sqrt{\frac{\sum(x_i - \bar{X})^2}{n}}$ $\sigma = \sqrt{\frac{\sum x_i^2}{n} - \bar{X}^2}$	Co efficient of Variation = $\frac{\sigma}{x} \times 100$	$\sigma_y = b \times \sigma_x$
	Standard Deviation for Two number = 2 Standard Deviations for first n Natural numbers, $\sigma = \sqrt{\frac{n^2-1}{12}}$	Combined Standard Deviation, $\sigma_{12} = \sqrt{\frac{n_1\sigma_1^2 + n_2\sigma_2^2 + n_1d_1^2 + n_2d_2^2}{n_1+n_2}}$ Where $d_1 = \bar{x}_1 - \bar{x}_{12}$, $d_2 = \bar{x}_2 - \bar{x}_{12}$	
Variance (σ^2)	Variance means Square of standard Deviation		

QUESTION 58

If all the observations are ^{add} Increased by 10, then

- A** SD would be increased by 10
- B** Mean deviation would be increased by 10
- C** Quartile deviation would increase by 10
- D** All these three remain unchanged.

$$y \equiv x + 10$$

$$M.D_y = M.D_x$$

$$Q.D_y = Q.D_x$$

$$S.D_y = S.D_x$$

QUESTION 59

If all the observations are, multiplied by 2, then

- A** New SD would be also multiplied by 2
- B** New SD would be half of the previous SD
- C** New SD would be increased by 2
- D** New SD would be increased by 2

$$y = 2 \cdot x$$

$SD_y = 2 \cdot SD_x$

QUESTION 60

The best statistical measure used for comparing two series is

- A** Mean absolute deviation
- B** Range
- C** Coefficient of variation
- D** Standard deviation

QUESTION 61

Which of the following is a relative measure of dispersion?

- A** Range
- B** Mean deviation
- C** Standard deviation
- D** Coefficient of quartile deviation 

QUESTION 62

The standard deviation for the set of numbers 1, 4, 5, 7, 8, is 2.45 nearly. If 10 is added to each number then new standard deviation is

A 24.45

B 12.45

C 2.45

D 0.245

$$x \rightarrow S.D.x = 2.45$$

$$y = x + 10$$

$$S.D.y = S.D.x = 2.45$$

THANK

YOU
