

Equations : Chapter 2

① Format of Simple Equations = $ax+b=0$, $a \neq 0$.

② Format of Equations (2 unknown) $\begin{cases} a_1x + b_1y + c_1 = 0 \\ a_2x + b_2y + c_2 = 0 \end{cases}$ $a \neq 0$.

For cross multiplication method,

$$\frac{x}{b_1c_2 - b_2c_1} = \frac{y}{c_1a_2 - c_2a_1} = \frac{1}{a_1b_2 - a_2b_1}$$

Solutions	1	∞ /coincident	0
conditions	$\frac{a_1}{a_2} \neq \frac{b_1}{b_2}$	$\frac{a_1}{a_2} = \frac{b_1}{b_2} = \frac{c_1}{c_2}$	$\frac{a_1}{a_2} = \frac{b_1}{b_2} \neq \frac{c_1}{c_2}$

Format of Equations 3 unknown,

$$\begin{cases} a_1x + b_1y + c_1z + d = 0 \\ a_2x + b_2y + c_2z + d = 0 \end{cases}$$

③ Quadratic Equations, Format = $ax^2 + bx + c = 0$, $a \neq 0$

2 methods \rightarrow Trial & error / Split middle term E

Formula method =

$$\frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

Sum of Roots, $\alpha + \beta = -b/a$

Product of Roots, $\alpha\beta = c/a$.

Construct a Q.E

$$x^2 - (\alpha + \beta)x + \alpha\beta = 0$$

Discriminant of Q.E = $b^2 - 4ac$

Condition	Nature of Roots
$b^2 - 4ac = 0$	Real and Equal
$b^2 - 4ac > 0$	Real & Unequal
$b^2 - 4ac > 0$ & a perfect sq.	Real, Unequal & Rational
$b^2 - 4ac > 0$ & not a perfect sq.	Real, unequal & irrational.
$b^2 - 4ac < 0$	Imaginary & unreal

when $(\alpha - \beta)$ is given in Qn use

$$(\alpha + \beta)^2 - (\alpha - \beta)^2 = 4ab$$

$$\begin{aligned} a^3 + b^3 &= (a+b)(a^2 - ab + b^2) \\ &= (a+b)[(a+b)^2 - 3ab] \end{aligned}$$

$$\begin{aligned} a^3 - b^3 &= (a-b)(a^2 + ab + b^2) \\ &= (a-b)[(a+b)^2 - ab] \end{aligned}$$

$$(a+b)^3 = a^3 + b^3 + 3ab(a+b)$$

$$(a-b)^3 = a^3 - b^3 + 3ab(a-b)$$

$$a^2 + b^2 = (a+b)^2 - 2ab$$

Conjugate Pairs - [one root is $m + \sqrt{n}$
then other is $m - \sqrt{n}$]

④ Cubic Equations, degree = 3

Format = $ax^3 + bx^2 + cx + d = 0, a \neq 0$

Method → Trial & error.

Just
glance

$$\alpha + \beta + \gamma = -b/a, \alpha\beta + \beta\gamma + \gamma\alpha = c/a, \alpha\beta\gamma = d/a$$

Chapter 1 - Ratio, Proportion, Indices & Logarithms

1) Ratio - E

Inverse - $a:b \rightarrow b:a$

Compounding, $a:b \& c:d$

(Multiply) = $ac : bd$

Duplicate = $a:b \rightarrow a^2:b^2$

Tripleate = $a:b \rightarrow a^3:b^3$

Sub duplicate = $a:b \rightarrow \sqrt{a}:\sqrt{b}$

Sub triplicate = $a:b \rightarrow \sqrt[3]{a}:\sqrt[3]{b}$

Commensurable $\rightarrow \sqrt{3}:\sqrt{2}$

In.

Continued Ratio $\rightarrow a:b:c$

2) Proportion

$$a:b = c:d \text{ or } a:b :: c:d.$$

Extremes

means.

$ad = bc$ (Product of Extremes
= Product of Means)

$$a:b = b:c \rightarrow b^2 = ac.$$

↓st mean proportional. ↓
Pro. 3rd P.W.

3) Properties of Proportion ($a:b = c:d$)

Invertendo $\rightarrow b:a = d:c$

Alternando $\rightarrow a:c = b:d$

Componendo $\rightarrow \frac{a+b}{b} = \frac{c+d}{d}$

Dividendo $\rightarrow \frac{a-b}{b} = \frac{c-d}{d}$

Componendo & Dividendo $\rightarrow \frac{a+b}{a-b} = \frac{c+d}{c-d}$

Addendo $\rightarrow \frac{a+c+e+f+\dots}{b+d+f+\dots} = K$

Subtrahendo $\rightarrow \frac{a-c-e-f-\dots}{b-d-f-\dots} = K$

If $a:b = c:d = e:f$
 $\therefore K = K$, then

4) Indices

$$a^m \times a^n = a^{m+n}$$

$$a^m/a^n = a^{m-n}$$

$$(a^m)^n = a^{mn}$$

$$(a \times b)^n = a^n \times b^n$$

$$a^0 = 1$$

$$3^4 = 81$$

Chapter 3: Linear Inequalities

$x <$ left

$x >$ Right

$y <$ Down

$y >$ Up.

5) Log

$$\log_a mn = \log_a m + \log_a n$$

$$\log_a \frac{m}{n} = \log_a m - \log_a n$$

$$\log_a m^n = n \log_a m$$

$$\log_a m^b = \frac{\log m}{\log b} = \frac{\log m}{\log a}$$

$$\log_3 81 = 4.$$

$$\log_b a \times \log_a b = 1.$$

$$④ FV = CF(1+i)^n$$

Annuity regular \rightarrow end of each period
Annuity due \rightarrow Beg. of each period

$$FVAR = A_I \left[\frac{(1+i)^n - 1}{i} \right]$$

$\brace{FVAF(n, i)}$

Use of FVAR → Final Value of
Sinking fund or Savings account to
achieve target maturity value

Annuity Regular = Annuity Immediate For Accumulating certain sum

$$FVAD = A_I \left[\frac{(1+i)^n - 1}{i} \right] [1+i]$$

FVAF(n, i)

use → End of period maturity value

If t^n silent → ANNUITY REGULAR

$$PV = \frac{CF}{(1+i)^n}$$

$$PVAR = A_I \left[\frac{1}{P} \left[1 - \frac{1}{(1+i)^n} \right] \right]$$

used → Calculation of loan amount,
Leasing & Capital Exp (Appn)

$$PVAF(n, i) = \boxed{1+i} \div \dots n \text{ times } \boxed{GT}$$

$$PVAD = [A_I \times PVAF(n-1, i)] + A_I$$

5 Application of TVOM & other concepts

- (a) Leasing - PV of annuity is compared with cash down price to decide if leasing is preferable.
- (b) Capital Exp. Decision - PV of future benefits due to new assets are compared with purchase value of asset, to decide whether to purchase or not.
- (c) Bond - PV of Interest Income [PVAR] and maturity value [PV of single CF] is compared with issue price of bond.
- (d) PVP = $\frac{A_I}{i}$ or $\frac{A_I}{i-g}$
- (e) PV (Growing Perpetuity) = $\frac{A_I}{i-g}$
- (f) NPV = PV of Cash Inflow - PV of cash outflow.
 $NPV \geq 0$, Accept Proposal.
 $NPV < 0$, Reject Proposal.
- (g) Real Rate of Return = Nominal Rate of Return - Inflation.
- (h) CAGR → Annual growth as per CI
 $A = P(1+i)^n$

Chapter - 5 : Permutations & Combinations

- ① Multiplication (AND) - No. of ways of doing both things simultaneously together = " $m \times n$ " ways.
- ② Addition (OR) - No. of ways of doing either of the jobs = " $m+n$ " ways.
- ③ $n!$ or $1! = n(n-1)(n-2) \dots 3 \times 2 \times 1$. $0! = 1$
- ④ Special formula in factorial, $n! = n(n-1)! + n(n-1)(n-2)!$
- ⑤ ${}^n P_n = \frac{n!}{(n-n)!}$, condition $n \geq 1$
- ⑥ ${}^n P_n = n!$, Also ${}^n P_n = {}^n P_{n-1} + \dots$ ${}^n P_1 \cdot n = +ve$
Integer
- ⑦ Special formula, $(n+1)! - n! = n \times n!$
- ⑧ Circular Permutations, $(n-1)!$
- ⑨ Circular Permutations when all objects are chosen out of n different objects such that no 2 persons have same 2 neighbours
 $(n-1)! \times \frac{1}{2}$ [SAME for necklace & garland etc]
- ⑩ When a particular object is not taken in Permutations,
 ${}^{n-1} P_{n-1}$
- ⑪ When a particular object is always included in arrangement,
i.e. ${}^{n-1} P_{n-1}$
- ⑫ ${}^{n-1} P_{n-1}$ (Always excluded) + $1 \cdot {}^{n-1} P_{n-1}$ (Always included) = ${}^n P_{n-1}$
↓
Total ways w/o restriction.
- ⑬ When never together = Total ways - Always Together
- ⑭ $P = \frac{n!}{n_1! n_2! n_3!}$

(15) Summation of Possible No's (1,2,3,4)

(a) Find no. of numbers that can be formed. $(1!) = 4! = 24$

(b) Repetition of each digit = $\frac{\text{Value of digit } a}{\text{no. of diff. digits}} = \frac{24}{4} = 6$.

(c) Sum of digits = $1+2+3+4 = 10$.

(d) Sum of digits \times Repetition = $10 \times 6 = 60$.

(e) Multiply (d) by 1111 or 111 for 4 digit or 3 digit no = $60(1111) = 66660$

(16) $nC_91 = \frac{n!}{(n-91)91!} = \frac{nP_91}{91!} \therefore 91! = \frac{nP_91}{nC_91}$

(17) $nC_0 = 1, nC_n = 1, nC_{91} = nC_{n-91}$

(18) Special Formula $\boxed{n+1 \\ C_{91} = nC_{91} + nC_{91-1}}$

(19) Combinations of one or more out of n things (when a choice)

$$\boxed{2^{n+1}}$$

(20) Combination of zero or more out of n things.

$$\boxed{2^n}$$

(21) Straight lines = nC_2 , with collinear = $nC_2 - mC_2 + 1$

(22) Triangles = nC_3 , with collinear = $nC_3 - mC_3$

(23) Parallelogram = $nC_2 \times mC_2$

(26) Chords of Circle is

(24) Diagonals = $nC_2 - n = \frac{n(n-3)}{2}$

$$\boxed{nC_2}$$

(25) Arrange \rightarrow Includes all $P_{n+1} \in C_7, nP_n \in nC_n$

Rearrange \rightarrow Excludes the one in or n from Total nP_n / nC_n

(26) No of factors = $(\text{power}+1) \times (\text{power}+1) \times (\text{power}+1)$

different factors = Exclude 1 from \uparrow

factors = Above formula

Chapter 6 : Sequence & Series

① nth element of sequence \rightarrow use options for $n = 1, 2, 3, 4$ & verify the terms. [Eg of n th element = $2n - 1$]

② AP, format $\rightarrow a, a+d, a+2d, a+3d, \dots, a+(n-1)d$.

calc trick,

$$[a+d] = \dots = \\ \text{Term: } 2^{\text{nd}} \quad 3^{\text{rd}} \quad n^{\text{th}}$$

3 terms	$b-a = c-b$
a, b, c are in AP	$a-b = b-c$
	$b = (a+c)/2$

3 No's in AP, $a-d, a, a+d$,

d can't be ZERO

$$S_n = \frac{n}{2} [2a + (n-1)d] = \frac{n}{2} [a + t_n]$$

Calc trick for S_n

$a+d$	$=$	\dots	$= GT + a$
Term 2 nd	3 rd	4 th	n th

First n natural no's, $S_n = \frac{n(n+1)}{2} = \leq n$.

First n odd no's, $S_n = n^2$

Square of first n natural no's, $S_n = \frac{n(n+1)(2n+1)}{6} = \leq n^2$

Cubes of first n natural no's, $S_n = \left[\frac{n(n+1)}{2} \right]^2$

③ GP, format = $a, ar, ar^2, ar^3, \dots, ar^{n-1}$.

$$r_1 = \frac{t_2}{t_1} = \frac{t_3}{t_2} = \frac{t_n}{t_{n-1}}$$

$$t_n = ar^{n-1}$$

calc trick $\rightarrow r_1 \times a = \dots = \underset{\text{Term: } 2^{\text{nd}}}{\underset{\downarrow}{\dots}} = \underset{\downarrow}{\underset{\text{3}^{\text{rd}}}{\dots}} = \underset{\downarrow}{\underset{\text{4}^{\text{th}}}{\dots}} = \underset{\downarrow}{\underset{\text{n}^{\text{th}}}{\dots}}$

3 No's in GP, $\frac{a}{r_1}, a, ar_1$

Calc trick for sum

$$S_n = \frac{a(1-r^n)}{(1-r)} \text{ or } \frac{a(r^n - 1)}{(r - 1)}$$

$$r_1 \times a = \dots = \underset{\downarrow}{\underset{\text{2}^{\text{nd}}}{\dots}} = \underset{\downarrow}{\underset{\text{3}^{\text{rd}}}{\dots}} = \dots = \underset{\downarrow}{\underset{\text{n}^{\text{th}}}{\dots}} = GT + a$$

$$S_{\infty} = \frac{a}{1-r}, \text{ Condition } -1 < r < 1$$

3 terms x, y, z are in GP	$\frac{x}{y} = \frac{y}{z}$ $x/y = y/z$ $y^2 = xz$
-----------------------------------	--

④ IMP POINTS

a) $AM = \frac{a+b}{2}, GM = \sqrt{ab}, HM = \frac{2ab}{a+b}$

$AM > GM > HM$ & $GM = \sqrt{AM \cdot HM}$ or $(GM)^2 = AM \cdot HM$

b) p^{th} term is a_1 , q^{th} term is a_k , then n^{th} term in AP is a_{p+q-1}

p^{th} term of GP is x , q^{th} term is y , then n^{th} term is $\left[\frac{x}{y} \right]^{\frac{n-p}{p-q}}$

c) when S_{∞} is given $[7 + 77 + 777 + \dots]$

\rightarrow find $S_2 = 7 + 77 = 84$

\rightarrow Use options, substitute $n=2$ & find option equal to 84.

d) When question gives, x, y, z are in AP assume $(1, 2, 3)$ & $x, y, (z+1)$ in GP assume $(1, 2, 4)$, then substitute values in options & see which condition is satisfied.

$$(1-a)^2 = a^2$$

$$\frac{a^2}{(1-a)^2} = \frac{a^2}{1-2a+a^2} = \frac{a^2}{(1-a)^2}$$

See W-B & IMP On

Chapter 14 : Central Tendency & Dispersion

A) Change of Origin = If a constant value is added or subtracted from each observations.

B) Change of Scale = If a constant value is multiplied or divided to all observations.

Measures of central Tendency:

① Arithmetic Mean:

Discrete Observations, $\bar{x} = \frac{x_1 + x_2 + x_3 + \dots + x_n}{n} = \frac{\sum x_i}{n}$

Simple FD (Discrete data), $\bar{x} = \frac{\sum f_x}{N}$ x_i = Individual Values.

Continuous FD, $\bar{x} = \frac{\sum f_x}{N}$ x_c = midpoint of C-I

Assumed mean
or Step deviation,

$$\bar{x} = A + \frac{\sum fd}{N} \times C.$$

where A = Assumed mean
 $\sum fd$ = frequency deviation
 $d = \frac{x - A}{C}$
 C = class length.

Property - ① If observation constant ($7, 7, 7$), AM also constant (7).

② Algebraic sum of deviations of a set of observation from their AM is zero, $\sum (x - \bar{x}) = 0$.

③ Affected both due to change of origin & change of scale

④ Combined AM, $\bar{x}_c = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$

Theory - ① Best measure of Central Tendency

② Based on all observations

③ Affected by sampling fluctuations

④ Amenable to mathematical property

⑤ Can't be used in case of open-end classification.

⑥ Rigidly defined.

Pooled mean = grouped mean.

Chapter 14 : Central Tendency & Dispersion

A) change of origin = If a constant value is added or subtracted from each observations.

B) change of scale = If a constant value is multiplied or divided to all observations.

Measures of central Tendency :

① Arithmetic Mean :

Discrete Observations, $\bar{x} = \frac{x_1 + x_2 + x_3 + \dots + x_n}{n}$

Simple FD (Discrete data), $\bar{x} = \frac{\sum fx}{N}$ x = Individual Values.

Continuous FD, $\bar{x} = \frac{\sum fx}{N}$ x = midpoint of C-I

Assumed mean or Step deviation, $\bar{x} = A + \frac{\sum fd}{N} \times C$ where A = Assumed mean
 $\sum fd$ = frequency deviation
 $d = \frac{x-A}{C}$
 C = class length.

Property - ① If observation constant (7,7,7), AM also constant (7)

② Algebraic sum of deviations of a set of observation from their AM is zero, $\sum(x - \bar{x}) = 0$.

③ Affected both due to change of origin & change of scale

④ Combined AM, $\bar{x}_c = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$

Theory - ① Best measure of Central Tendency

② Based on all observations

③ Affected by Sampling fluctuations

④ Amenable to mathematical property

⑤ Can't be used in case of open-end classification.

⑥ Rigidly defined.

Pooled mean = grouped mean.

④ Median : [Arrange in ascending order]

Discrete Observations, $n = \text{odd}$, then middle term

$n = \text{even}$, then average of 2 middle terms

Simple frequency dist, ① Arrange ascending order.

② Find LCF

③ Calculate $\left(\frac{N+1}{2}\right)^{\text{th}}$ observations.

④ Locate value in LCF & corresponding x value
is median

Grouped FD, ① Find LCF

② Find $N/2$ & identify median class.

③ Calculate data for formula.

④ Apply formula

$$M_e = l_1 + \left[\frac{N/2 - N_1}{N_u - N_1} \right] c.$$

$(N_u - N_1)$ = Frequency of median class.

l_1	LCB of median class
N_u	Cum. frequency of median class
N_1	Cum. frequency of Pre-median class
c	class length

Properties - ① Sum of Absolute deviation is minimum, when the deviations are taken from median. $\sum |x - M_e| = \min$.

② Affected by both change of origin & scale.

Theory - ① Positional Average

② Not based on all observations.

③ Not affected by Sampling fluctuations.

④ Best measure of central tendency in case of open end classes.

⑤ Not affected by presence of extreme values.

⑥ Based on 50% of central values.

Partition Values

Name of PV.	No. of equal parts	No. of PV's	Symbol
Median.	2	1	M_e
Quartile	4	3	Q_1, Q_2, Q_3
Decile	10	9	D_1, D_2, \dots, D_9
Percentile	100	99	$P_1, P_2, P_3, \dots, P_{99}$

Partition Values

Discrete Observations, Rank calculation = $(n+1)p^{\text{th}} \text{ term}$.
Values of p depends on partition values.

#	Median	Quartile	Decile	Percentile
1st	$\frac{l_1 + l_2}{2}$	$\frac{l_1 + l_2}{4}$	$\frac{l_1 + l_2}{10}$	$\frac{l_1 + l_2}{100}$
2nd	-	$\frac{l_1 + l_2}{4}$	$\frac{l_1 + l_2}{10}$	$\frac{l_1 + l_2}{100}$
Last	-	$\frac{l_1 + l_2}{4}$	$\frac{l_1 + l_2}{10}$	$\frac{l_1 + l_2}{100}$

How Q_1 25th Term =

$$l_1 + f \left(\frac{N}{4} - N_1 \right)$$

Grouped FD, Q_1 class = $N/4$, $Q_1 = l_1 + \left[\frac{N/4 - N_1}{f} \right] c$. $N_1 = \text{LCF}$
(STEPS LIKE of Pre- MEDIAN) Q_3 class = $3N/4$, $Q_3 = l_1 + \left[\frac{3N/4 - N_1}{f} \right] c$. median class

$$D_1 \text{ class} = N/10, D_1 = l_1 + \left[\frac{N/10 - N_1}{f} \right] c$$

$$D_9 \text{ class} = 9N/10, D_9 = l_1 + \left[\frac{9N/10 - N_1}{f} \right] c$$

$$P_1 \text{ class} = N/100, P_1 = l_1 + \left[\frac{N/100 - N_1}{f} \right] c$$

$$P_{99} \text{ class} = 99N/100, P_{99} = l_1 + \left[\frac{99N/100 - N_1}{f} \right] c$$

- ③ Mode: Value occurs maximum times.
- 2 or more observations with same frequency \rightarrow multiple modes (multimodal dist)
 - 2 observations with same frequency \rightarrow Bimodal dist
 - If all obs. have same freq. \rightarrow no mode.

Grouped FD, ① Modal class = CI (class interval) corresponding to highest frequency.

$$\textcircled{2} M_O = l_1 + \left[\frac{f_0 - f_1}{2f_0 - f_1 - f_2} \right] c$$

$f_0 = f \text{ of modal class}$
 $f_1 = f \text{ of premodal class}$
 $f_2 = f \text{ of postmodal class}$

- Property - ① All observation constant, then mode also constant.
② Mode is affected by both change of scale & origin.

Theory - ① Not based on all obs.

- ② Not rigidly defined or it is not uniquely defined

- ③ Not amenable to Mathematical Property.

Relationship between Mean, Median & Mode

① Symmetric Dist. = Mean = Median = Mode.

② Moderately Skewed Dist. (empirical method) = $\text{Mean} - \text{Mode} = 3(\text{Mean} - \text{Median})$
 $\text{Mode} = 3\text{Median} - 2\text{Mean}$.

④ Geometric Mean - n^{th} root of product of n positive observations.

Discrete obser., $G_1 = (x_1 \cdot x_2 \cdot x_3 \cdots x_n)^{1/n}$

Frequency dist., $G_1 = [x_1^{f_1} \cdot x_2^{f_2} \cdots x_n^{f_n}]^{1/N}$ $[N = \sum f]$

Property - ① $\log G_1 = \frac{1}{n} \sum \log x_i$, \log of G_1 of set of observations is the AM of \log of observations.

② If all observations were constant, GM also constant.

③ If $z = xy$, then GM of $z = \text{GM of } x \cdot \text{GM of } y$

④ If $z = x/y$, then GM of $z = \frac{\text{GM of } x}{\text{GM of } y}$

Theory - ① Not suited when '-ve' values are present (losses).

② Appropriate for rates having percentages (%)

③ Difficult to compute ($\gg \bar{x}, M_e \& M_o$)

⑤ Harmonic Mean - for a set of non zero observations, Reciprocal of AM of reciprocal of observations.

Discrete observations, $H = \frac{n}{\sum(1/x)}$ $FQ = \frac{N}{\sum(f/x)}$

Property - ① If all observations are constant, HM also constant.

② Combined HM, $H_c = \frac{n_1 + n_2}{\frac{n_1}{H_1} + \frac{n_2}{H_2}} = \frac{n_1 + n_2 (H_1, H_2)}{n_1 H_2 + n_2 H_1}$

• Weighted HM = $\frac{\sum w}{\sum(w/x)}$

Theory - ① Not used when zero is in observations

② Appropriate for rates other than Percentage (%)

* Note: HM & GM are used for calculating averages, rates

Relationship between AM, GM & HM

Scenario	Relation
All observations are same/identical	$AM = GM = HM$
Observations are distinct	$AM > GM > HM$
Observation is silent	$AM \geq GM \geq HM$

only 2 observations
Then,
 $AM \cdot HM = (GM)^2$

Weighted Averages

- ① Weighted AM = $\frac{\sum w_i x_i}{\sum w_i}$
- ② Weighted GM = $(x_1^{w_1} \cdot x_2^{w_2} \cdot x_3^{w_3} \cdots x_n^{w_n})^{\frac{1}{\sum w_i}}$
- ③ Weighted HM = $\frac{\sum w_i}{\sum (w_i/x_i)}$

Measures of Dispersion (ONLY AFFECTED BY CHANGE OF SCALE) (CAN'T BE NEGATIVE)

- ① Range - Discrete = $L - S$, L = Largest obs, S = Smallest obs.
(Absolute measure) Grouped FD = $L - S$, L = UCB of last C-I
 S = LCB of first C-I

$$\text{Coefficient of Range} = \frac{L - S}{L + S} \times 100. \quad (\text{Relative measure})$$

- Properties - Not affected by change of origin

Affected by change of scale (only value, ignore sign)

No Impact of sign of change of scale.

Can't be Negative : Note

Theory - Not based on all observation & ez to compute.

- ② Mean Deviation - Based on absolute deviation only.

Discrete obs, $MD_A = \frac{1}{n} \sum |x - A|$ A = appropriate central tendency

Freq. dist, $MD_A = \frac{1}{N} \sum f|x - A|$ (Absolute measure)

Coefficient of MD = $\frac{MD \text{ about } A}{A} \times 100. \quad (\text{Relative measure})$

- Properties - ① It takes its minimum value when deviations are taken from median. (1st Property of Median)
- ② Change of origin - no effect, change of scale - effect of value not sign.

- Theory - ① Based on all observations & absolute deviations.
- ② Improvement over range
- ③ Difficult to compute
- ④ Not amenable to Mathematical Property because of usage of modulus.

- ③ Standard deviation - Improvement over MD.

(Absolute)

$$\text{Discrete obs., } \sigma_x = SD_x = \sqrt{\frac{\sum (x - \bar{x})^2}{n}} = \sqrt{\frac{\sum x^2}{n} - (\bar{x})^2}$$

$$\text{Freq. dist., } \sigma_x = SD_x = \sqrt{\frac{\sum f(x - \bar{x})^2}{N}} = \sqrt{\frac{\sum fx^2}{N} - (\bar{x})^2}$$

(Relative)

$$\text{Coefficient of Variation} = \frac{SD_x}{\bar{x}} \times 100$$

$$\text{Variance} = (SD)^2$$

$$SD \text{ of any 2 numbers} = \frac{\text{Range}}{\sqrt{2}}, \quad SD \text{ for 1st } n \text{ natural nos.} = \sqrt{\frac{n^2 - 1}{12}}$$

- Property - ① If all obs. constant, then SD is ZERO
- ② No effect of change of origin but affected by change of scale in magnitude (ignore sign)

$$③ SD_C = \sqrt{\frac{n_1 s_1^2 + n_2 s_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$$

$$d_1 = \bar{x}_C - \bar{x}_1, \quad d_2 = \bar{x}_C - \bar{x}_2$$

Theory - Most useful measure of SD.

Measure of dispersion considered for finding pooled measure of dispersion after combining several groups.
(Combined SD)

If all obs. have same freq, then ignore freq.

Not used if data is open-ended.

④ Quartile Deviation

$$QD_x = \frac{Q_3 - Q_1}{2}$$

(Semi-inter quartile range)

$$\text{Interquartile range} = Q_3 - Q_1$$

$$\text{Median} = \frac{Q_3 + Q_1}{2}$$

$$\text{Coefficient of } QD_x = \frac{Q_3 - Q_1}{Q_3 + Q_1} \times 100$$

- Theory -
- ① Best measure of dispersion for open-end classification
 - ② Less affected by sampling fluctuations
 - ③ Not affected by presence of extreme observations
 - ④ Based ^{on} central 50% of observations.
 - ⑤ QD not affected by change of origin, but only change of scale ignoring sign.

Relationships between AM, SD, MD & QD

$$4SD = 5MD = 6QD \quad \text{or} \quad SD : MD : QD = 15 : 12 : 10$$

Note -

- ① Change of scale & origin - central Tendency
- Change of Scale ($\times k$) - Dispersion (check 79th Qn)

② The more the coefficient of variation less consistent the data will be.

③ If in QD Var. is given of X & var of y is asked then first find SD of X ($\sqrt{\text{Var}(X)}$) & then find SD of y [change of scale only] and then square SD of y to find Var. of y .

Chapter 7 - Sets, Relations & Functions

$$x \in y, y = \square$$

Chapter 15: Probability [READ THEORY & IMP from WB & PC]

① Classical Probability

- Subjective and Objective probability are the 2 broad divisions.
- The term 'chance' & probability are synonymous. - True
- Total no of possible outcomes = p^n [$p = \text{no of events in trial}$, $n = \text{no. of trials}$]
- $P(A) = \frac{\text{no of fav. outcomes}}{\text{Total no. of outcomes}}$, $P(A) = 1$ \Rightarrow Sure Event & $P(A) = 0$ \Rightarrow Impossible Event
- $0 \leq P(A) \leq 1$
- $P(\bar{A} \text{ or } A') = 1 - P(A)$
- Playing Cards, Total 52 [13 in Spades, Clubs, Hearts, Diamond]
 - Black: KQJ → Face Cards.
 - Red: 10, 9, 8, 7, 6, 5, 4, 3, 2, A
- 2 Unbiased coins = HT, TT, HH, TH. (2^2)
- 3 unbiased coins = HHH, HTH, HTH, THH, THT, TTH, TTT, HHT (2^3)
- odd in favour = $\frac{\text{favourable}}{\text{unfavourable}}$, odds against = $\frac{\text{unfavourable}}{\text{favourable}}$

② Set Based Probability

- $P(A) = \frac{n(A)}{n(S)} = \frac{\text{no. of sample points in set } A}{\text{no. of sample points in sample spaces}}$
- $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
- 2 Mutually Exclusive.
- $P(A \cup B \cup C) = P(A) + P(B) + P(C) + P(A \cap B \cap C) - P(A \cap B) - P(B \cap C) - P(C \cap A)$
- Expected frequency of Event A = $P(A) \times N$.
- $P(A - B) \text{ or } P(A \cap B') = P(A) - P(A \cap B)$
- $P(B - A) \text{ or } P(A' \cap B) = P(B) - P(A \cap B)$

③ Conditional Probability

$$P(B/A) = \frac{P(A \cap B)}{P(A)} \quad \& \quad P(A/B) = \frac{P(A \cap B)}{P(B)}$$

($P(A) \neq 0$) ($P(B) \neq 0$)

Compound Theorem for dependent events:

$$P(A \cap B) = P(B/A) P(A)$$

$$P(A \cap B) = P(A/B) P(B)$$

Compound Theorem for Independent events.

$$P(A \cap B) = P(A) \cdot P(B)$$

$$P(A' \cap B) = P(A') \cdot P(B) \text{ or } P(B \cap A)$$

$$P(A \cap B') = P(A) \cdot P(B') \text{ or } P(A \cap B')$$

$$P(A' \cap B') = P(A) \cdot P(B') \text{ or } P(A \cap B')$$

1. If $A \cup B \cup C$ are non-overlapping events

De Morgan's law $\rightarrow P(A \cup B \cup C) = 1 - P(A \cap B \cap C)^c$

$= 1 - P(A^c \cap B^c \cap C^c)$

$= 1 - [P(A^c) \cdot P(B^c) \cdot P(C^c)]$

Random Variable (RV)

- $M = E(X) = \sum P X, \sum P = 1$
- $\text{Var} = \sigma^2 = \sum (x_i - M)^2 = E[X^2] - [E(X)]^2$
- $\sigma^2 = \sum P X^2 - [\sum P X]^2$

Relative frequency = $\frac{\text{Class frequency}}{\text{Total frequency}}$

$$P(A) = \lim_{n \rightarrow \infty} \frac{f_A}{n}$$

If x is a RV & a, b are constant

- $E(a) = a$
- $E(ax) = a E(x)$
- $E(ax+b) = a E(x) + b$
- $\text{Var}(a) = 0$
- $\text{Var}(ax) = a^2 \text{Var}(x)$
- $\text{Var}(ax+b) = a^2 \text{Var}(x)$

Chapter - 16 : Binomial Theoretical Distribution

① Binomial Distribution [Method of moments applied]

- Discrete & Bi-parametric with parameters n & p (2)

- $\text{pmf}, f(x) = P(X=x) = {}^n C_x \cdot p^x \cdot q^{n-x}$, $x=0, 1, 2, \dots, n$
 $q = 1-p$

- mean, $\mu = np$; variance, $\sigma^2 = npq$; SD, $\sigma = \sqrt{npq}$

- Mean is ALWAYS MORE than Variance. $[\mu > \sigma^2]$

- Maximum Value of Variance = $n/4$.

- Symmetrical if $p = 1/2$

- Mode = $(n+1)p$ → If result is → Non Integer → One mode

[UNI-modal or Bimodal]

↓
Integer (whole +ve no.)

(value in decimal) Considerably
the number of not points

2 MODES
 \downarrow
 $(n+1)p \neq (n+1)p - 1$

- Additive identity, If $X \sim B(n_1, p)$ & $Y \sim B(n_2, p)$ then $X+Y \sim B(n_1+n_2, p)$

- Tends to → Poisson → $n=\infty, p=0, np=\lambda$

- → Normal → $n=\infty, p$ almost equal to q .

② Poisson Distribution [Unimodal or Bimodal]

- Discrete & unparametric distribution.

- Always positively skewed.

- m - given or np .

- $\text{pmf}, P(X=x) = \frac{e^{-m} \cdot m^x}{x!}$, x can take whole no. value from 0 to $n(\infty)$

- $\mu = m$, $\sigma^2 = m$, $SD/\sigma = \sqrt{m}$.

- Mode → Integer → $[m \& m-1]$

- → Non Integer → $[m]$

$e = \text{euler's constant}$
 $= 2.71828$

m can't be NEGATIVE

- Additive Prop., If $X \sim P(m_1)$ & $Y \sim P(m_2)$ then $X+Y \sim P(m_1+m_2)$

- If m is large, poisson dist → Normal dist. \hat{P}

Chapter - 16 : Binomial Theoretical Distribution

① Binomial Distribution [Method of moments applied]

- Discrete & Bi-parametric with parameters n & p . (2)

- pmf, $P(X=x) = P(X=x) = {}^n C_x \cdot p^x \cdot q^{n-x}$, $x=0, 1, 2, \dots, n$
 $q = 1-p$

- mean, $\mu = np$; variance, $\sigma^2 = npq$; SD, $\sigma = \sqrt{npq}$

- Mean is ALWAYS MORE than Variance. [$\mu > \sigma^2$]

- Maximum Value of Variance = $n/4$.

- Symmetrical if $p = 1/2$

- Mode = $(n+1)p$ → If result is → Non Integer → one mode
 ↓
 (value in decimals) consider only
 Integer (whole & even no.)
 ↓
 2 MODES

[UNI-modal or
Bimodal]

$$(n+1)p \text{ & } (n+1)p - 1$$

- Additive Identity, If $X \sim B(n_1, p)$ & $Y \sim B(n_2, p)$ then $X+Y \sim B(n_1+n_2, p)$

- Tends to → Poisson → $n=\infty, p=0, np=\lambda$

- → Normal → $n=\infty, p$ almost equal to q .

② Poisson Distribution [Unimodal or Bimodal]

- Discrete & unparametric distribution.

- Always positively skewed.

- m - given or np .

- pmf, $P(X=x) = \frac{e^{-m} \cdot m^x}{x!}$, x can take whole no. value from 0 to $n(\infty)$

- $\mu = m$, $\sigma^2 = m$, $SD/\mu = \sqrt{m}$.

$$\begin{aligned} e &= \text{euler's constant} \\ &= 2.71828 \end{aligned}$$

- Mode → Integer → $[m \text{ & } m-1]$

- → Non Integer → $[m]$

m can't be NEGATIVE

- Additive Prop., If $X \sim P(m_1)$ & $Y \sim P(m_2)$ then $X+Y \sim P(m_1+m_2)$

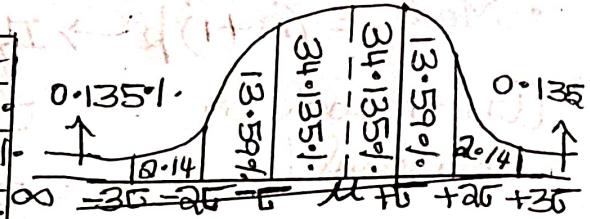

- If m is large, poisson dist → normal dist. \hat{P}

③ Normal Distribution (AKA GAUSSIAN)

- When RV is continuous & Bi-parametric. ($\mu \& \sigma^2$)
- Mean = Median = Mode = μ (Symmetrical dist.)
- Mean deviation = 0.8σ , $\text{MD} = 0.675\sigma$
- Quartiles $\rightarrow Q_1 = \mu - 0.675\sigma$ & $Q_3 = \mu + 0.675\sigma$
- Ratios BTW SD:MD:MD = $15:12:10$.
- PDF, $f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\left(\frac{(x-\mu)^2}{\sigma^2}\right)}$
- Normal curve is also called as probability curve. It is Bell shape.
- Points of Inflections are $\mu - \sigma$ & $\mu + \sigma$
- Area under normal curve is 1/unity

From	To	Avg Prob
μ	$\mu + \sigma$	34.135%
$\mu + \sigma$	$\mu + 2\sigma$	13.59%
$\mu + 2\sigma$	$\mu + 3\sigma$	2.14%
$\mu + 3\sigma$	∞	0.135%

From	To	Avg Prob
$\mu - \sigma$	$\mu + \sigma$	68.27%
$\mu - 2\sigma$	$\mu + 2\sigma$	95.45%
$\mu - 3\sigma$	$\mu + 3\sigma$	99.73%

- Additive property of Normal Distribution:

$$X \sim N(\mu_1, \sigma_1^2) \text{ & } Y \sim N(\mu_2, \sigma_2^2) \text{ then } X+Y \sim N(\mu_1+\mu_2, \sigma_1^2+\sigma_2^2)$$

④ Standard Normal Distribution

- Condition, $\mu = 0$ & $\sigma = 1$
- Mean = Median = Mode = 0
- Convert X to Z , $Z = \frac{X-\mu}{\sigma}$
- $\sigma^2 = 1$ as $\sigma = 1$
- Points of inflection are -1 & $+1$
- Cumulative distribution function, $F(x) = P(X \leq x)$ or $\Phi(k) = P(Z \leq k)$

$$\begin{aligned} \text{• MD} &= 0.8 \quad (\text{as } \sigma = 1) \\ \text{• } Q_1 &= 0.675 \end{aligned}$$

$F(x)$ or $\Phi(k)$ gives area from $-\infty$ to point K in a std. dist.

Chapter - 17 : Correlation & Regression

Theory - ① Bivariate data - Data collected from ~~on~~ 2 variable simultaneously & corresponding frequency derived from it is Bivariate FD.

② Marginal Distribution - Frequency dist. of one variable (X or Y) across the other's full range of values

$$\text{No. of Marginal Dist.} = 2$$

③ Conditional Dist. - FD of one variable (X or Y) across a particular sub-population of the other variable.

$$\text{No. of conditional dist.} = m+n$$

$$\text{No. of Cells} = m \times n$$

④ Correlation analysis aims at establishing relation between 2 variables & measuring the extent of relation between 2 variables

⑤ Spurious correlation is correlation between 2 variables having no causal relation.

⑥ Scatter diagram useful for linear & non-linear correlation also. It helps find relative strength of correlation.

Karl Pearson's Coefficient of Correlation

- used to understand nature as well as accurate strength / amount of correlation

- $r_1 = 1$, Perfect Positive & $r_1 = -1$, Perfect -ve'

$$r_{xy} = \frac{\text{Cov}(x,y)}{(\sqrt{x} \cdot \sqrt{y})}, \quad \text{Cov}(x,y) = \frac{\sum (x-\bar{x})(y-\bar{y})}{n} = \frac{\sum xy - \bar{x} \cdot \bar{y}}{n}$$

Property - ① Unit-free measure (Inclusive) ③ No impact of change of origin.

② Value lies from -1 to $+1$

④ No impact of value of change of scale, but if change of scale of both variables are of different sign.

then sign of r_1 will also change

$$x \xrightarrow[\text{scale}]{} \text{chg of } x \quad + - - +$$

$$y \xrightarrow[\text{scale}]{} \text{chg of } y \quad - + - +$$

r_1 will change or won't
sign change sign remains same

* Product of SD of X & Y should be ~~less~~ MORE THAN OR EQUAL TO Covariance.

* Used to find Correlation for linear Only

③ Normal Distribution (AKA Gaussian) ($\mu \text{ & } \sigma^2$)

- $y = a + bx$, $r_{xy} = +1$ if $b > 0$
- $r_{xy} = \text{Perfect}$ $r_{xy} = -1$ if $b < 0$.
- ($+/-$) (a need not be positive)
- Covariance can be either positive, negative or zero.

Spearman's Rank Correlation Coefficient

- Correlation between 2 attributes (Beauty) marks

$$\textcircled{1} \quad r_s = 1 - \frac{6 \sum d^2}{n(n^2-1)} \quad d = \text{difference of ranks}$$

$$\textcircled{2} \quad r_s = 1 - \frac{6(\sum d^2 + A)}{n(n^2-1)}, \quad A = \frac{\sum (t^3 - t)}{12} \quad A = \text{adjustment value}$$

(In case of tie) $t = \text{tie length.}$

Coefficient of Concurrent Deviations

- Very quick, simple & casual method of finding correlation when not serious about magnitude of 2 variables

$$r_c = \pm \sqrt{\frac{2c - m}{m}} \quad c = \text{no. of concurrent deviation (Same direction)} \\ m = \text{no. of pairs compared, i.e. } (n-1)$$

limit \rightarrow Between $-1 \leq +1$, inclusive.

Regression Basics

- Regression analysis is concerned with establishing a mathematical relationship between 2 variables & predicting value of dependent variable for given value of independent variable
- 2 Regression lines when identical $r = -1$ or $+1$.

Formula of Regression lines

Estimation of Y when X is given

$$Y - \bar{Y} = b_{yx}(x - \bar{x})$$

b_{yx} = Regression coefficient of Y on X

$$b_{yx} = r \cdot \frac{SD_y}{SD_x} = \frac{\text{Cov}(X, Y)}{(SD_x)^2}$$

Regression Equations = 2

Estimation of X when Y is given.

$$x - \bar{x} = b_{xy}(y - \bar{y})$$

b_{xy} = Regression coefficient of X on Y .

$$b_{xy} = r \cdot \frac{SD_x}{SD_y} = \frac{\text{Cov}(X, Y)}{(SD_y)^2}$$

$r_{xy} = +1$ if $b > 0$. Covariance can be either positive or negative.

Properties - ① Change of Scale - No impact, change of scale impacts both magnitude & sign.

$$b_{uv} = b_{xy} \times \frac{\text{change of scale of } x}{\text{change of scale of } y} \quad b_{vu} = b_{yx} \times \frac{\cos y}{\cos x}$$

② Two regression lines (if not identical) will intersect at the point (means).

③ Correlation coefficient is GM of regression coefficients,

$$r_{xy} = \pm \sqrt{b_{xy} \cdot b_{yx}} \quad r_{xy}, b_{xy}, b_{yx} \text{ all have same sign}$$

- Product of regression coefficients b_{xy} & b_{yx} should be less than one or unity.
- Methods to form regression equations is called as method of least squares.

y on x is formed by minimisation of vertical distances of scatter diagram.

x on y is formed by minimisation of horizontal distances of scatter diagram.

Difference between estimated & observed value is error/residue.

Error/Residue can be +ve, zero or -ve.

Coefficient of Determination & Non Determination

Coefficient of Determination / Accounted Variance / Explained Variance = $(r_{xy})^2$

Coefficient of non determination / unaccounted variance / Unexplained variance = $1 - (r_{xy})^2$

Spearman's Rank Correlation - $\text{Incorrect } \sum d^2 - \frac{(\text{wrong value})^2 + (\text{correct value})^2}{2} = \text{Correct } \sum d^2$

Correlation Concurrent deviations

$$\text{Standard Error} = \frac{1 - r^2}{\sqrt{N}}, \text{ Probable Error} = 0.675 \times \frac{1 - r^2}{\sqrt{N}}$$

Coefficient of determination is (BOTH BELOW)

$$r^2 = \frac{1 - \text{unexplained variance}}{\text{Total Variance}}, r^2 = \frac{\text{Explained Variance}}{\text{Total Variance}}$$

Chapter - 18 : Index Numbers [READ W.B FOR THEORY & MCQ]

- ① Index Numbers are a series of numerical figures which show the relative position.
- ② Fisher's Index no. is an ideal index no. $\sqrt{P_1 P_0}$ it satisfies $\frac{\text{TRT}}{\text{FRT}}$
- ③ Test of adequacy/consistency (4) - unit, TRT, FRT, Circular Test
- ④ $P_{01} = 1$ on 0, $P_{10} = 0$ on 1
- ⑤ Circular test is satisfied by simple GM of price relatives & weighted aggregative with fixed weights.
- ⑥ Fisher's ideal index doesn't satisfy Circular test
- ⑦ Circular test is an extension of TRT $[P_{01} \times P_{12} \times P_{20} = 1]$
- ⑧ Index no's are expressed as percentages.
- ⑨ CLI is always weighted index no.
- ⑩ Index no's are helpful in framing economic policies, revealing trend, forecasting, comparison.
- ⑪ Circular test is known for shift base index no.
- ⑫ Laspeyres' index no. is based on last ^(base) weights.
- ⑬ Purchasing power of money is reciprocal of price index no.
- ⑭ Base Period is considered as POINT OF REFERENCE.
- ⑮ Weighted GM of relative satisfies TRT
- ⑯ Unit test is not satisfied by Simple Aggregative.
- ⑰ Best Avg for construction of Index no. is GM. (Most used - AM)
- ⑱ Fisher's method of construction of Index no's uses GM
- ⑲ When product on Price index & Qty index is equal to value index then the test hold is FRT.
- ⑳ Two opposite indices are reciprocal of each other in case of TRT $(P_{01} = 1/P_{10})$
- ㉑ Splicing means constructing one continuous series from two different indices on the basis of common sense.

FORMULA'S

- ① Price Relative = $\frac{P_n}{P_0} \times 100.$
- ② Link Relative = $\frac{P_1}{P_0}, \frac{P_2}{P_1}, \dots, \frac{P_n}{P_{n-1}}$
(Next/Previous)
- ③ Chain Relative / Indices = $\frac{P_1}{P_0}, \frac{P_2}{P_0}, \dots, \frac{P_n}{P_0}$
Indices. (Year/Base) wise
- ④ Chain Index / Relatives = Link Relative of CY \times chain Index of PY
$$\left[\frac{P_2}{P_1} \times \frac{P_1}{P_0} = P_2/P_0 \right] \quad 100.$$
- ⑤ Shifted Price Index = $\frac{\text{Original Price Index}}{\text{Price index of year on which it has to be shifted}} \times 100.$
- ⑥ Simple Aggregative Method = $\frac{\sum P_n}{\sum P_0} \times 100.$
- ⑦ Simple Avg of Relatives method = $\frac{\sum (P_n/P_0)}{N} \quad [N/n = \text{No of Years}]$

⑧ Method's name	Remark	Formula
Laspeyres' Index	Weight - Base Yr Orty	$\frac{\sum P_n Q_{10}}{\sum P_0 Q_{10}} \times 100$
Pasche's Index	Weight - CY Orty	$\frac{\sum P_n Q_{1n}}{\sum P_0 Q_{1n}} \times 100$
Marshall Edgeworth's Index.	Weight - Sum of BY Orty & CY Orty.	$\frac{\sum P_n (\theta_{10} + \theta_{1n})}{\sum P_0 (\theta_{10} + \theta_{1n})} \times 100$
Fisher's Index	GM of Laspeyres' & Pasche's Index	$\sqrt{\frac{\sum P_n Q_{10}}{\sum P_0 Q_{10}} \times \frac{\sum P_n Q_{1n}}{\sum P_0 Q_{1n}}} \times 100.$
Bowley's Index	AM of Laspeyres & Pasche's Index	$\frac{\frac{\sum P_n Q_{10}}{\sum P_0 Q_{10}} + \frac{\sum P_n Q_{1n}}{\sum P_0 Q_{1n}}}{2} \times 100$

- ⑨ Weighted Aggregative of Price Relatives = $\frac{\sum P_n}{P_0} \times \frac{P_0 Q_{10}}{\sum P_0 Q_{10}} \times 100 = \frac{\sum P_n Q_{10}}{\sum P_0 Q_{10}} \times 100$
(Same as Laspeyres!)
- ⑩ Deflated Value = $\frac{\text{Current Value}}{\text{Price Index of CY}}$
