

## CA FOUNDATION QUANTS

# Chp14 Measures of Central Tendency & Dispersion

MARATHON SERIES

# Plan & Approach

- Revision of all concepts from Comprehensive Book
- PYQs (Past Paper MCQs) of each topic *last 3 papers*
- Substantial Coverage of Syllabus (80+)
- Dedicated Theory *hai Zaroori* Live Session
- 10 Live Sessions, 2 Recorded Sessions *as per Schedule*

# DETAILED SCHEDULE

Date	Day	Mode	Start	End	Chapters	Marks
01-Jan-26	Thu	Live	3.15 pm	5.30 pm	Math for Finance	14
02-Jan-26	Fri	Live	3.15 pm	5.30 pm	Measures of Central Tendency and Dispersion	10
03-Jan-26	Sat	Recorded	3.15 pm	5.30 pm	Blood Relations and Direction Test	10
04-Jan-26	Sun	Recorded	3.15 pm	5.30 pm	Seating Arrangements and Number Series..	10
05-Jan-26	Mon	Live	3.15 pm	5.30 pm	Correlation and Regression	5
06-Jan-26	Tue	Live	3.15 pm	5.30 pm	Index Numbers and Sequence Series	8
07-Jan-26	Wed	Live	3.15 pm	5.30 pm	Ratio Proportion Indices Logarithm	4
08-Jan-26	Thu	Live	3.15 pm	5.30 pm	Equations and Linear Inequalities	6
09-Jan-26	Fri	Live	3.15 pm	5.30 pm	Permutations and Combinations	5
10-Jan-26	Sat	Live	3.15 pm	5.30 pm	Set Relation and Functions	4
11-Jan-26	Sun	Live	3.15 pm	5.30 pm	Theory hai Zaroori Edition 2026	10
12-Jan-26	Mon	Live	3.15 pm	5.30 pm	100Marks Full Syllabus Test Live with Discussion in Session itself

# Concepts

## Central Tendency - Basics

<b>Meaning</b>	<ul style="list-style-type: none"> <li>Central Tendency is the <b>tendency</b> of a given set of <b>observations</b> to <b>cluster</b> around a single <b>central or middle</b> value.</li> <li>The <b>single value</b> that represents the given set of observations is described as a <b>measure of central tendency</b>.</li> </ul>
<b>Different Measures of Central Tendency</b>	<ul style="list-style-type: none"> <li>Arithmetic Mean (AM)</li> <li>Median (Me)</li> <li>Mode (Mo)</li> <li>Geometric Mean (GM)</li> <li>Harmonic Mean (HM)</li> </ul>
<b>Types of Formula based Questions</b>	<ul style="list-style-type: none"> <li>Discrete Observations <b>11, 13, 20, 34</b></li> <li>Simple Frequency Distribution</li> <li>Grouped Frequency Distribution</li> </ul>

$\underline{x}$	$f$	$x_m$	$f$	$x_m$
0 - 10	2	5	7	2
10 - 20	4	15	10	9
20 - 30	3	25		

## Arithmetic Mean

<i>Discrete Observations</i>	$\bar{x} = \frac{x_1 + x_2 + x_3 + \dots + x_n}{n}$	$\bar{x} = \frac{\sum x}{n}$
<i>Frequency Distribution</i>	$\bar{x} = \frac{\sum fx}{N}$	
	<i>In case of simple frequency distribution</i>	$x = \text{individual values}$
	<i>In case of grouped frequency distribution</i>	$x = \text{mid-point of class intervals}$
<i>Assumed Mean / Step-Deviation Method</i>	<p style="text-align: center;"><i>AM using assumed mean / step deviation method</i></p> $\bar{x} = A + \frac{\sum fd}{N} \times C, \text{ where } d = \frac{x - A}{C}, A \text{ is assumed mean, } C \text{ is class length}$	
<i>Property 1</i>	<p style="text-align: center;"><i>If all the observations are constant, AM is also constant</i></p>	
<i>Property 2</i>	<p style="text-align: center;"><i>the algebraic sum of deviations of a set of observations from their AM is zero</i></p>	
<i>Property 3</i>	<p style="text-align: center;"><i>AM is affected both due to change of origin and scale</i></p> $\text{If } y = a + bx \text{ then } \bar{y} = a + b\bar{x}$	
<i>Property 4</i>	<p style="text-align: center;"><i>Combined AM</i></p> $\bar{x}_c = \frac{n_1 \bar{x}_1 + n_2 \bar{x}_2}{n_1 + n_2}$	

## General Review

- AM is **best measure of central tendency**
- AM is **based on all observations**
- AM is **affected by sampling fluctuations**
- AM is **amenable to mathematical property**
- AM cannot be used in case of **open end classification**

Below 10  
10 - 20  
20 - 30 }  $x_m$   
 $\alpha$

## Median

<b>Discrete Observations</b>	<ul style="list-style-type: none"> <li>• If <math>n = \text{odd}</math>, then middle term</li> <li>• If <math>n = \text{even}</math>, average of two middle terms</li> </ul>																												
<b>Simple Frequency Distribution</b>	<ul style="list-style-type: none"> <li>• First make column of less than cumulative frequency</li> <li>• Apply same formula as discrete</li> </ul>																												
<b>Grouped Frequency Distribution</b>	<p><i>Median in case of grouped frequency distribution</i></p> <table border="1" data-bbox="796 476 2332 1023"> <tr> <td data-bbox="796 476 975 541">Step 1</td><td colspan="4" data-bbox="975 476 2332 541"><i>Prepare a less than type cumulative frequency distribution</i></td></tr> <tr> <td data-bbox="796 541 975 735">Step 2</td><td colspan="4" data-bbox="975 541 2332 735"><i>Calculate <math>\frac{N}{2}</math> and check between which class boundaries it falls and call it as Median Class</i></td></tr> <tr> <td data-bbox="796 735 975 1023" rowspan="2">Step 3</td><td data-bbox="975 735 1154 822"><math>l_1</math></td><td data-bbox="1154 735 1589 822"><math>N_u</math></td><td data-bbox="1589 735 2024 822"><math>N_l</math></td><td data-bbox="2024 735 2332 822">C</td></tr> <tr> <td data-bbox="975 822 1154 1023"><i>LCB of Median Class</i></td><td data-bbox="1154 822 1589 1023"><i>Cum Freq. of Median Class</i></td><td data-bbox="1589 822 2024 1023"><i>Cum. Freq. of Pre-Median Class</i></td><td data-bbox="2024 822 2332 1023"><i>Class length of Median Class</i></td></tr> <tr> <td data-bbox="796 1023 975 1347" rowspan="2">Step 4</td><td colspan="4" data-bbox="975 1023 2332 1095"><i>Apply Formula</i></td></tr> <tr> <td colspan="4" data-bbox="975 1095 2332 1347"> <math display="block">Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{N_u - N_l} \right) \times C \quad \text{or} \quad Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{f} \right) \times C</math> </td></tr> </table>	Step 1	<i>Prepare a less than type cumulative frequency distribution</i>				Step 2	<i>Calculate <math>\frac{N}{2}</math> and check between which class boundaries it falls and call it as Median Class</i>				Step 3	$l_1$	$N_u$	$N_l$	C	<i>LCB of Median Class</i>	<i>Cum Freq. of Median Class</i>	<i>Cum. Freq. of Pre-Median Class</i>	<i>Class length of Median Class</i>	Step 4	<i>Apply Formula</i>				$Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{N_u - N_l} \right) \times C \quad \text{or} \quad Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{f} \right) \times C$			
Step 1	<i>Prepare a less than type cumulative frequency distribution</i>																												
Step 2	<i>Calculate <math>\frac{N}{2}</math> and check between which class boundaries it falls and call it as Median Class</i>																												
Step 3	$l_1$	$N_u$	$N_l$	C																									
	<i>LCB of Median Class</i>	<i>Cum Freq. of Median Class</i>	<i>Cum. Freq. of Pre-Median Class</i>	<i>Class length of Median Class</i>																									
Step 4	<i>Apply Formula</i>																												
	$Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{N_u - N_l} \right) \times C \quad \text{or} \quad Me = l_1 + \left( \frac{\frac{N}{2} - N_l}{f} \right) \times C$																												

<b>Property 1</b>	<p>For a set of observations, the sum of absolute deviations is <b>minimum</b>, when the deviations <b>are taken from the median</b>. <math>\sum  x - Me </math> is minimum</p>
<b>Property 2</b>	<p>Median is also affected by both <b>change of origin and scale</b>.</p>
<b>General Review</b>	<ul style="list-style-type: none"><li>Median is also called as <b>positional average</b></li><li>Median is <b>not based on all observations</b></li><li>Median is <b>less</b> affected by <b>sampling fluctuations</b></li><li>Median is <b>best measure</b> of central tendency in case of <b>open-end classification</b></li></ul>

## Partition Values

- These may be defined as *values dividing a given set of observations into number of equal parts*
- When we want to divide the given set of observations into two equal parts, we consider median, similarly there are quartiles, deciles, percentiles

### Meaning

Name of PV	No. of equal parts	No. of PVs	Symbol
Median	2	1	$Me$
Quartile	4	3	$Q_1, Q_2, Q_3$
Decile	10	9	$D_1, D_2, \dots, D_9$
Percentile	100	99	$P_1, P_2, \dots, P_{99}$

**Formula –  
Discrete  
Observations**

- Rank Calculation  $(n+1)p^{\text{th}}$  term
- Value of  $p$  depends on partition value

$$Q_3 = \frac{(n+1) \times 3}{4} \quad D_3 = \frac{(n+1) \times 1}{4}$$

#	Median	Quartile	Decile	Percentile
First	1/2	1/4	1/10	1/100
Second		2/4	2/10	2/100
...				
Last		3/4	9/10	99/100

**Quartiles  
Grouped FD**

Quartiles in case of Grouped Frequency Distribution: Steps are like median with few modifications.

1 <sup>st</sup> Quartile	3 <sup>rd</sup> Quartile
$\text{Find } Q_1 \text{ class using } \frac{N}{4}$ $Q_1 = l_1 + \left( \frac{\frac{N}{4} - N_l}{N_u - N_l} \right) \times C$	$\text{Find } Q_3 \text{ class using } \frac{3N}{4}$ $Q_3 = l_1 + \left( \frac{\frac{3N}{4} - N_l}{N_u - N_l} \right) \times C$

## Mode

<b>Meaning</b>	<i>Mode is the value that occurs the maximum number of times</i>						
<b>Special Thing about Mode</b>	<ul style="list-style-type: none"><li><i>If two or more observations are having maximum frequency then there are <b>multiple modes</b> [multimodal distribution]</i></li><li><i>If there are <b>exactly two</b> modes then distribution is called as <b>Bimodal Distribution</b></i></li><li><i>If all observations are having same frequency then distribution has <b>no mode</b></i></li><li><i>We can say that Mode is <b>not rigidly defined</b></i></li></ul>						
<b>Grouped Frequency Distribution</b>	<ul style="list-style-type: none"><li><i>Find <b>Modal Class</b>: Class with highest frequency and obtain below values</i></li></ul> <table border="1"><tr><td><math>f_{-1}</math></td><td><math>f_0</math></td><td><math>f_1</math></td></tr><tr><td><i>frequency of pre modal class</i></td><td><i>frequency of the modal class</i></td><td><i>frequency of the post modal class</i></td></tr></table> <ul style="list-style-type: none"><li><i>Apply Formula</i></li></ul> $Mo = l_1 + \left( \frac{f_0 - f_{-1}}{2f_0 - f_{-1} - f_1} \right) \times C$	$f_{-1}$	$f_0$	$f_1$	<i>frequency of pre modal class</i>	<i>frequency of the modal class</i>	<i>frequency of the post modal class</i>
$f_{-1}$	$f_0$	$f_1$					
<i>frequency of pre modal class</i>	<i>frequency of the modal class</i>	<i>frequency of the post modal class</i>					

<b>Property 1</b>	<i>If all the observations are constant, mode is also constant</i>
<b>Property 2</b>	<i>Mode is also affected both due to change of origin and scale</i>
<b>General Review</b>	<ul style="list-style-type: none"><li>• Mode is <b>not based on all observations</b></li><li>• Mode is <b>not rigidly defined/ uniquely defined</b></li><li>• Mode <b>is not amenable to Mathematical Property</b></li></ul>

### *Relationship between Mean, Median and Mode*

<i>In case of Symmetric Distribution</i>	<b>Mean = Median = Mode</b>
<i>In case of Moderately Skewed Distribution (Empirical relationship)</i>	$\text{Mean} - \text{Mode} = 3(\text{Mean} - \text{Median})$ $\text{OR Mode} = 3\text{Median} - 2\text{Mean}$

## Geometric Mean

<b>Definition</b>	For a given set of $n$ positive observations, the geometric mean is defined as the $n^{\text{th}}$ root of the product of the observations
<b>Formula – Discrete</b>	$G = (x_1 \times x_2 \times \dots \times x_n)^{1/n}$
<b>Formula – Frequency Distribution</b>	$G = (x_1^{f_1} \times x_2^{f_2} \times \dots \times x_n^{f_n})^{1/N}$
<b>Property 1</b>	Logarithm of $G$ for a set of observations is the AM of the logarithm of the observations $\log G = \frac{1}{n} \sum \log x$
<b>Property 2</b>	If all the observations are constant, GM is also constant
<b>Property 3</b>	If $z = xy$ , then GM of $z$ = GM of $x \times$ GM of $y$
<b>Property 4</b>	If $z = x/y$ , then GM of $z$ = $\frac{\text{GM of } x}{\text{GM of } y}$

## Harmonic Mean

<b>Definition</b>	<i>For a given set of non-zero observations, harmonic mean is defined as the reciprocal of the AM of the reciprocals of the observation</i>
<b>Formula – Discrete</b>	$H = \frac{n}{\sum\left(\frac{1}{x}\right)}$
<b>Formula – Frequency Distribution</b>	$H = \frac{N}{\sum\left(\frac{f}{x}\right)}$
<b>Property 1</b>	<i>If all observations are constant HM is also constant</i>
<b>Property 2</b>	$\text{Combined HM} = \frac{n_1 + n_2}{\frac{n_1}{H_1} + \frac{n_2}{H_2}}$

## Use of GM and HM

<b>Both</b>	<i>Both are used for calculating average rates</i>
<b>GM</b>	<i>Appropriate for rates having percentages</i>
<b>HM</b>	<i>Appropriate for rates other than percentages</i>

## Relationship between AM, GM, and HM

<b>Relation</b>	<b>Scenario</b>	<b>Relation</b>
	<i>When all the observations are same/ identical</i>	$AM = GM = HM$
	<i>When observations are distinct</i>	$AM > GM > HM$
	<i>In question is silent</i>	$AM \geq GM \geq HM$
<b>Special Relation</b>	<i>If there are only two observations:</i> $AM \times HM = (GM)^2$	

$$AH = G^2$$

## Weighted Average

<b>When to use</b>	<i>If the observations are not of equal importance and we need to treat observations according to their hierarchical importance, then we use Weighted Average</i>	
<b>Formulas</b>	<b>Weighted AM</b>	$\frac{\sum wx}{\sum w}$
	<b>Weighted GM</b>	$\left( x_1^{w_1} \times x_2^{w_2} \times x_3^{w_3} \times \dots \times x_n^{w_n} \right)^{\frac{1}{\sum w}}$
	<b>Weighted HM</b>	$\frac{\sum w}{\sum \left( \frac{w}{x} \right)}$

## Measures of Dispersion

<b>Meaning of Measure of Dispersion</b>	<ul style="list-style-type: none"><li>Dispersion for a given set of observations may be defined as</li><li>the amount of deviation of the observations,</li><li>usually, from an appropriate measure of central tendency</li></ul>	
<b>Types of Measure of Dispersion</b>	<b>Absolute Measures of Dispersion</b>	<ul style="list-style-type: none"><li>These are with units</li><li>These are not useful for comparison of two variables with different units.</li><li>Example: Range, Mean Deviation, Standard Deviation, Quartile Deviation</li></ul>
	<b>Relative Measures of Dispersion</b>	<ul style="list-style-type: none"><li>These are unit free measures</li><li>These are useful for comparison of two variables with different units.</li><li>Example: Coefficient of Range, Coefficient of Mean Deviation, Coefficient of variation, Coefficient of Quartile Deviation</li></ul>

## Range

<b>Discrete – Formula</b>	$L - S$ <p>where,  <math>L</math>: Largest Observation, <math>S</math>: Smallest Observation</p>
<b>Grouped Frequency Distribution – Formula</b>	$\frac{L - S}{L + S}$ <p>where,  Largest Observation = UCB of last class interval,  Smallest Observation = LCB of first-class interval</p>
<b>Coefficient of Range</b>	$\frac{L - S}{L + S} \times 100$
<b>Property 1</b>	<ul style="list-style-type: none"> <li>Not affected by change of origin</li> <li>Affected by change of scale (only value)</li> <li>No impact of sign of change of scale</li> <li>Note: Measure of Dispersion can never be negative</li> </ul>
<b>General Review</b>	<ul style="list-style-type: none"> <li>Not Based on All Observations</li> <li>Easy to Compute</li> </ul>

$$R_x = 10$$

## Mean Deviation

<b>Meaning</b>	<ul style="list-style-type: none"> <li>• Mean deviation is defined as the arithmetic mean of the absolute deviations of the observations</li> <li>• from an appropriate measure of central tendency</li> </ul>
<b>Formula – Discrete</b>	$MD_A = \frac{1}{n} \sum  x - A $ <p>where, <math>A</math> = Appropriate Central Tendency Measure</p>
<b>Formula – Frequency Distribution</b>	$MD_A = \frac{1}{N} \sum f  x - A $
<b>Coefficient of Mean Deviation</b>	Coefficient of Mean Deviation: $\frac{\text{Mean Deviation about } A}{A} \times 100$
<b>Property 1</b>	Mean Deviation takes its minimum value when deviations are taken from Median
<b>Property 2</b>	Change of Origin – No Affect, Change of Scale – Affect of value not sign

$$R_x = 10, \quad y = 2x + 3$$

$$y = -2x + 3$$

$$R_y = 2 \times 10 = 20$$

$$R_y = 2 \times 10 = 20$$

## General Review

- *Based on all observations*
- *Improvement over Range*
- *Difficult to compute*
- *Not amenable to Mathematical Property because of usage of Modulus*

## Standard Deviation

<b>Meaning</b>	<ul style="list-style-type: none"><li>Improvement over Mean Deviation</li><li>It is defined as the <b>root mean square deviation</b> when the deviations are <u>taken from the AM</u> of the observations</li></ul>
<b>Formula – Discrete</b>	$\sigma_x = SD_x = \sqrt{\frac{\sum (x - \bar{x})^2}{n}}$ $\sigma_x = SD_x = \sqrt{\frac{\sum x^2}{n} - (\bar{x})^2}$
<b>Formula – Frequency Distribution</b>	$\sigma_x = SD_x = \sqrt{\frac{\sum f(x - \bar{x})^2}{N}}$ $\sigma_x = SD_x = \sqrt{\frac{\sum fx^2}{N} - (\bar{x})^2}$
<b>Coefficient of Variation</b>	$\frac{SD_x}{\bar{x}} \times 100$

<i>SD for any two numbers</i>	$SD = \frac{\text{Range}}{2}$
<i>SD for first n natural numbers</i>	$s = \sqrt{\frac{n^2 - 1}{12}}$
<b>Property 1</b>	<i>If all the observations are constant, SD is ZERO</i>
<b>Property 2</b>	<i>No effect of change of origin but affected by change of scale in the magnitude (ignore sign)</i>
<b>Property 3</b>	$SD_c = \sqrt{\frac{n_1 s_1^2 + n_2 s_2^2 + n_1 d_1^2 + n_2 d_2^2}{n_1 + n_2}}$ $d_1 = \bar{x}_c - \bar{x}_1, d_2 = \bar{x}_c - \bar{x}_2$

## Quartile Deviation

Formula	<b>semi inter quartile range</b> $QD_x = \frac{Q_3 - Q_1}{2}$
Calculation	Quartiles are calculated same as we studied in Central Tendency
Coefficient of Quartile Deviation	$\frac{Q_3 - Q_1}{Q_3 + Q_1} \times 100$
General Review	<ul style="list-style-type: none"><li>It is the <b>best measure</b> of dispersion for <b>open-end classification</b></li><li>It is also <b>less affected</b> due to <b>sampling fluctuations</b></li><li>Like other measures of Dispersion, <b>QD</b> is also not affected by change of origin but affected by scale ignoring sign</li></ul>
Relationship between SD, MD and QD	$4SD = 5MD = 6QD$ or $SD : MD : QD = 15 : 12 : 10$

PYQ Sep 2025

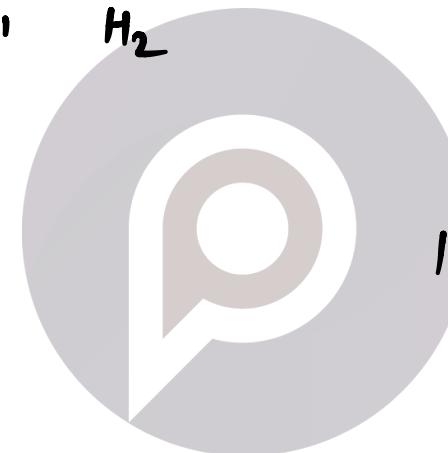

(21) If there are two groups with 10 and 12 observations and harmonic mean of the two groups are 3 and 5 respectively, then the combined Harmonic mean is

- a. 8.0
- b. 2.0
- c. 3.8
- d. 4.0

$$n_1 = 10 \quad n_2 = 12$$

$$H_1 = 3 \quad H_2 = 5$$

$$H_C = \frac{\frac{n_1 + n_2}{n_1 + n_2}}{\frac{1}{H_1} + \frac{1}{H_2}}$$

$$\frac{10+12}{\frac{10}{3} + \frac{12}{5}} = X 22$$

(45) A helicopter flies from A to B at the rate of 500 km/hr. and comes back at the rate 700 km/hr.

The average speed of the helicopter is

- a. 600 km/hr
- b. 583.33 km/hr
- c.  $100\sqrt{35}$
- d. 620 km/hr

km/hr

$$n=2$$

$$\frac{2}{\frac{1}{500} + \frac{1}{700}} = 583.33$$

(48) Find out co-efficient of variation, if  $N = 14$ ,  $\sum fx$  = 280 and  $\sigma$  (S.D.) = 3.

a. 20      ✓b. 15  
c. 4.67      d. Zero

$$\text{co. of variation} = \frac{SD}{AM} \times 100$$

$$= \frac{3}{20} \times 100 = 15$$

$$\begin{aligned}
 \text{AM} &= \frac{\sum fx}{N} \\
 &= \frac{280}{14} \\
 &= 20
 \end{aligned}$$

(49) The monthly profit/loss for six months of the firm is as under:

Month	Profit/ Loss in ₹
Jan	1,000
Feb	900
Mar	0
Apr	-200
May	-400 (S)
Jun	2,000 (L)

The coefficient of range of the above data is

- a. 122
- b. 150**
- c. 33.33
- d. 55.55

$$\frac{L-S}{L+S} \times 100$$

$$\frac{2000 - (-400)}{2000 + (-400)} \times 100$$

$$\frac{2400}{1600} \times 100 = 150 =$$

(51) If the mean of the following frequency distribution is 2.6, then the value of Y is

X (marks)	1	2	3	4	5
No. of students (f)	8	10	Y	2	4

24+Y

- a. 16
- b. 6
- c. 26
- d. 12

$$\frac{\sum fx}{N} = 2.6$$

$$\frac{8 \times 1 + 10 \times 2 + Y \times 3 + 2 \times 4 + 4 \times 5}{24+Y} = 2.6$$

$$24+Y$$

$$\frac{56 + 3Y}{24+Y} = 2.6$$

$$\Rightarrow 56 + 3Y = 62.4 + 2.6Y$$

$$0.4Y = 6.4$$

Y = 16

(52) Which one of the following measures of central tendency is based on only fifty percent (50%) of the central values?

- a. GM
- b. HM
- c. Median
- d. Mode

## PYQ May 2025

(53) The Arithmetic Mean (A.M.) and mode of the data are 32 and 26, respectively, then find the median of the data.

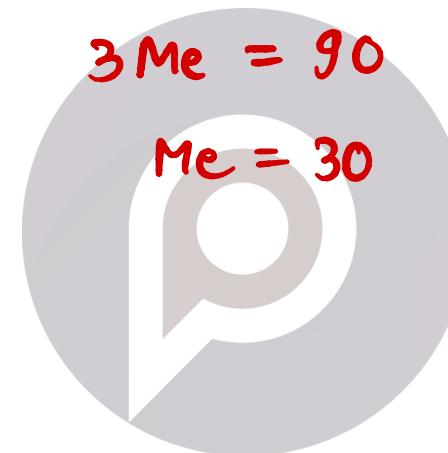

a. 30      b. 12  
c. 6      d. 32

$$\text{Mode} = 3 \text{ Median} - 2 \text{ Mean}$$

$$26 = 3 \text{ Median} - 2 \times 32$$

$$3 \text{ Median} = 90$$

$$\text{Median} = 30$$

PYQ May 2025

(55) Which one of the following is the absolute measure of dispersion for open ended distributions?

- a. Range
- b. SD
- c. MD
- d. QD

CA  
PRANAV  
POPAT

(3) The mean of three numbers is 135. Among the three numbers the biggest number is 180. The difference between the remaining two numbers is 25. Then the smallest number is

a. 130      b. 125  
c. 120      d. 100

let smallest no. be  $a$

biggest no. is 180

so middle no. is  $a+25$

$$\frac{a + (a + 25) + 180}{3} = 135$$

3

$$2a + 205 = 405$$

$$a = 100$$

(11) Mean deviation is minimum when the deviations are taken from the median.

- a. Maximum
- b. Minimum
- c. Zero
- d. Cant Say

CA

POPAT

PYQ Jan 2025

(12) If  $x$  and  $y$  are related as  $4x + 2y + 12 = 0$  and mean deviation of  $x$  is 4.5, then the mean deviation of  $y$  is

- a. -9
- b. 9**
- c. 1.1
- d. 4.5

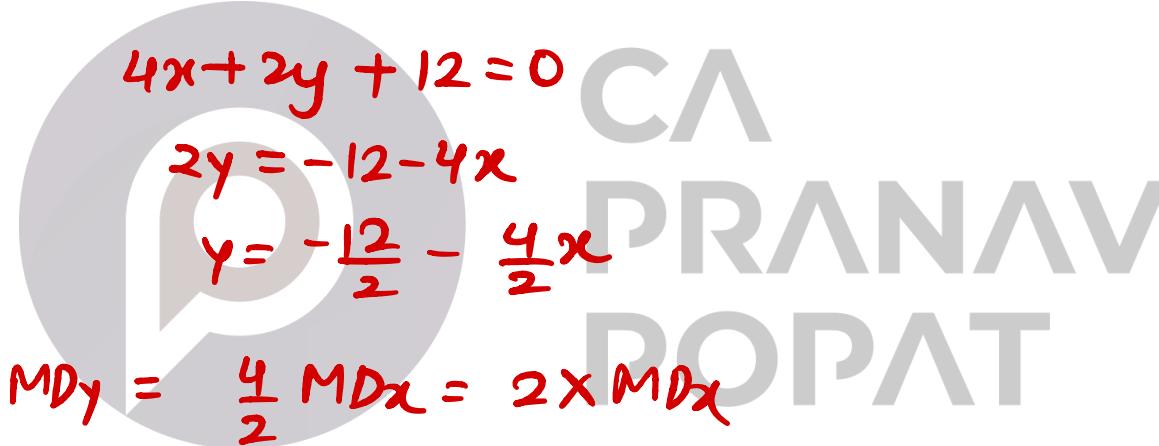

MD is Measure of disp so only affected by  
change of scale

$$4x + 2y + 12 = 0$$

$$2y = -12 - 4x$$

$$y = -\frac{12}{2} - \frac{4x}{2}$$

$$\begin{aligned}
 MD_y &= \frac{4}{2} MD_x = 2 \times MD_x \\
 &= 2 \times 4.5 \\
 &= 9
 \end{aligned}$$

PYQ Jan 2025

(13) For a distribution the mean is 30. The standard deviation is 2, then coefficient of variation is

a. 6.67%      b. 9.45%  
c. 7.5%      d. 2.5%

$$\text{Co. of var} = \frac{SD}{AM} \times 100$$
$$= \frac{2}{30} \times 100 = 6.67\%$$

CA  
PRANAV  
POPAT

(15) The algebraic sum of deviation of set of observations from their arithmetic mean is

a.  $\frac{\sum x_i}{n}$

b.  $\sqrt{\frac{(\sum x_i - \bar{x})^2}{n-1}}$

c.  $\frac{\sum x_i}{n-1}$

d. ~~✓~~ Zero

CA  
PRANAV  
POPAT

(16) Find the Harmonic Mean of 2, 4 & 6.

*a.* ✓ 3.30      *b.* 3.00  
*c.* 3.75      *d.* 4.00

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{6} = \underline{\underline{3.27}}$$

CA  
PRANAV  
POPAT

(17) If the mode of the following data is 13, then the value of  $x$  in the data set is 13, 8, 6, 3, 8, 13,  $2x+3$ , 8, 13, 3, 5, 7

- a. 6
- b. 5
- c. 7
- d. 8

if mode is 13 then freq of 13 should be 3

$$\Rightarrow 2x+3 = 13$$

$$\Rightarrow x = 5$$

(18) *The best measure of central tendency is*

- a. Mean
- b. Median
- c. Mode
- d. Range

CA  
PRANAV  
POPAT

(23) The standard deviation of the data 2, 4, 5, 6, 8, 17 is 23.33, then the standard deviation of the data 4, 8, 10, 12, 16, 34 is

- a. 23.33
- b. 46.66
- c. 12.23
- d. 0

here all original obs are multiplied by 2

so new SD =  $2 \times$  old SD

$$= 2 \times 23.33$$

$$= 46.66$$

CA  
PRANAV  
POPAT

(24) The values of the first quartile and third quartile are 36.50 and 57.50. Then the semi-inter-quartile range is

- a. 47.50
- b. 12.50
- c.  10.50
- d. 11.50

$$\text{semi interqrt range} = \frac{Q_3 - Q_1}{2}$$

CA  
PRANAV  
POPAT

(25) The AM & GM for two observations are 8 and 2. Find the values of two observations.

a.  15.75, 0.25      b. 16, 1  
c. 15, 1      d. 14.75, 1.75

a) 
$$\frac{15.75 + 0.25}{2} = 8$$
      
$$\sqrt{15.75 \times 0.25} = 1.984 \sim 2$$
